**NEW!**

**Qdry Automated Critical Point Dryer**

With automated control, the Qdry ensures repeatable outcomes with minimal user intervention. Built-in adiabatic cooling allows for fast cool-down rates and more throughput.

**Features**
- Easy-to-use and flexible software allowing for quick set-up of profiles.
- Status display to indicate time remaining.
- Recipe driven, with individual user profiles for quick set-up time.
- Supplied with pre-set profiles covering different sample types allowing easy start for new samples.
- Screw top chamber for easy sample loading.
- Large viewing window ensuring observation of process flow.
- Small footprint ideal for use in fume hoods.

**NEW!**

**MiniQ GD For Surface Modification of TEM Grids**

Designed with simplicity in mind, the easy-to-use MiniQ GD allows for surface modification of TEM grids, resulting in the clear imaging of macromolecules.

**Features**
- Simple operation.
- Robust touch panel.
- Small footprint.
- Automatic operation with minimal user intervention required.
- Detachable chamber with implosion guard allowing for easy cleaning.
- Preset profiles with single touch operation.

**Recommended Applications**
- Changing wettability of surfaces, primarily used for TEM grids to improve the spread of particles/molecules on them.
- Could also be used for SEM and AFM imaging when samples are applied onto substrate surfaces from liquid.
- Soft cleaning of surfaces.

**Specifications**

Please note, the MiniQ GD specifications are based on use with a Pfeiffer Duo 6 pump. For more information regarding pump options please contact info@emsdiasum.com

Why cool?
Low vacuum (LV) or variable pressure (VP) modes are now standard on most scanning electron microscopes (SEMs). For this reason it has become important to control water evaporation from wet specimens. Cooling such specimens reduces the loss of water by evaporation, or - depending on chamber pressure - can prevent it altogether.
Saturated vapour pressure of water decreases considerably with temperature. At room temperature, water will very quickly evaporate - causing considerable damage to specimen composition and ultra-structure. This is due to high forces of surface tension at the drying front as it passing through the specimen. In most biological systems this will result in distortion and collapse of membranes and other structures.
At 300Pa, the specimen temperature needs to be less than -9.5°C, and at 85Pa less than -25°C to stop water evaporation. Therefore, by cooling a specimen to -25°C, chamber pressures up to 85Pa can be used with little or no water loss by evaporation. In this way, changes in specimen structure can be minimised. In addition, being able to operate at higher vacuum gives a better signal-to-noise ratio and clearer images.

The EMS Coolstage for SEM, LV or VP

OVERVIEW
The Coolstage is a Peltier-driven SEM cooling stage for scanning electron microscopy (SEM), low vacuum (LV) or variable pressure (VP) applications. The stage can be cooled to sub-zero temperatures for specimens that may be sensitive at ambient temperature, subject to beam damage, or may otherwise ‘sublime’ (lose water) at ambient temperatures.
There are three versions of coolstage - Standard, Enhanced, and Ultra - to cover differing specimen requirements.

FEATURES

Standard Coolstage
- Temperature range -30°C to +50°C at 300Pa
- Self contained cooling - no additional external cooling water needed
- Temperature accuracy +/- 1.5°C or 2% - whichever is greater
- Minimal image drift
- Cooling and heating rates of up to 30°C per minute
- Keypad control - with simultaneous display of actual and target temperature
- Supplied with SEM chamber port feed-through - specify when ordering
- One-year warranty

Enhanced Coolstage
- Temperature range -30°C to +160°C at 300Pa
- All other specifications as per Standard Coolstage

Ultra Coolstage
- Temperature range -50°C to +50°C at 300Pa
- All other specifications as per Standard Coolstage

PRODUCT DESCRIPTION
The Coolstage is a temperature-controlled specimen stage that can be fitted to any low vacuum (LV) or variable pressure (VP) scanning electron microscope (SEM).
The Standard Coolstage consists of a single stage Peltier device, onto which a thermally isolated specimen holder and dual temperature sensor is mounted. The Coolstage assembly is mounted onto the SEM stage using an adaptor plate specific to the microscope. Cooling pipes and electrical wires connect to the SEM feedthrough flange. External components are a recirculating water chiller and power supply case, and a compact keypad for digital temperature readout and control.

Compact, efficient cooling and temperature control
The temperature range of the Standard Coolstage is -30°C to +50°C at 300Pa. The specimen holder is water-cooled using a small, self-contained closed loop recirculating chiller that is normally positioned approx 2m from the SEM. A microprocessor controls and monitors the temperature of the cold stage. A small keypad is used to set the required temperature and display target and current temperatures.
The EMS Coolstage (continued)

The specimen holder has been designed to minimise image drift due to temperature change, giving a stable image at high magnification. An integrated RS-232 interface allows temperature to be set and read from the SEM.

Rapid specimen exchange

To exchange a specimen it is necessary to increase the specimen stage temperature to ensure that condensation does not form on the specimen or specimen stage. The keypad controller has a convenient ‘exchange’ button that will automatically take the specimen holder temperature to a programmable temperature from between +5°C to +20°C. Typical cooling and heating rates are up to 30°C per minute.

When not in use, the major parts of the system can be left in situ and the cooling stage is very easily removed when reverting to ‘normal’ use. A convenient storage block is provided for Coolstage stage assembly and vacuum feedthrough for when the system is not in use.

EMS 3500 Thermocirculator

The EMS 3500 Thermocirculator is a low cost, portable water circulating system for supplying a constant temperature supply for closed and open loop applications at near ambient to +60°C.

Features
- Precise control of heating
- Compact
- Robust and reliable
- No running water to waste
- Ideal for use with the EMS 3100 Critical Point Dryer

The EMS 3500 is suitable for open and closed loop applications and has all controls and liquid connections on the front panel. The temperature controller shows not only the ‘set’ temperature (between ambient and +65°C), but also the actual liquid temperature. The fluid is circulated by a glandless magnetic pump, through an aluminum reservoir.

A cooling coil is mounted in the liquid reservoir. This coil can be directly connected to the main water supply and is primarily used when temperature control near to ambient is required. The electronic control system features a zero voltage switching unit which minimizes mains electrical interference, enabling the EMS 3500 to be used and sited with other sensitive electronic instruments.

ORDERING INFORMATION

91095    EMS 3500 Thermocirculator    each
EMS 4800 Recirculating Heater/Chillers

Recommended for open and closed loop applications, offering simplicity, reliability and quiet operation. The range includes the EMS 4860, 4870, 4880 and 4890.

Features
- Precise temperature control
- Proven reliability
- Quiet, efficient operation
- Low maintenance
- Environmentally friendly- avoids running water to waste

Temperature control

Many instruments measuring physical properties depend on accurate control of temperature and in some processes optimum temperature is essential. With the EMS 4800 series, over-cooling (which affects efficiency) is prevented and the water temperature can be accurately controlled over the range -10 to +60°C.

A commonly misunderstood feature of refrigerated systems is in applications where the control temperature is other than at or near room temperature. When the instruments are to be operated at controlled temperatures below ambient, the extraction deteriorates significantly and, as a guide, the compounded change is 4% per degree Celsius. In practice, the refrigerant gas pressure has to be adjusted to optimize the performance at any particular temperature. However, the EMS 4800 series incorporate automatic adjustment valves in the systems.

The EMS 4800 series are of the ‘closed loop’ type and therefore efficiencies are dramatically improved compared with open bath models. They are simple to set up and to operate, and essentially maintenance free.

Choosing the correct heater/chiller

In order to optimize performance from a heater/chiller system, the correct specification must be selected for a particular application. To cool or heat any instrument or system it is important to obtain the following information from the manufacturer:
- Heat load to be dissipated to water, eg for an electron microscope: diffusion pump heater, lenses, etc
- Flow rate and size of tubing
- Minimum pressure

With this information, consult the Specifications below and select the appropriate heater/chiller. The basic heat load calculation formula is as follows:

Some typical applications

Vacuum coating equipment
Critical point dryers
(EMS 3000 and EMS 3100)
Electron microscopes
Chromatography equipment
Electrophoresis baths
Environmental chambers
Crystal growth apparatus
Fermentation equipment
Interferometers
Photographic baths
X-ray equipment
and many others

Optional Attachments
- High pressure pump for EMS 4860 and EMS 4870 (standard in EMS 4880 and EMS 4890)
- Water failure alarm
- Over and under temperature cut out

NOTE: Larger capacity heater/chillers (6kW and 12kW) are available on request - please contact us for further information.

- Custom-made heater/chiller units

Unique Dual Chamber Processing, Safe Handling of Reagents

The GloQube Plus has two independent vacuum chambers: a clean chamber, designed for applications requiring hydrophobic/hydrophilic conversion, typically using air as the process gas; and a vapor chamber, designed for use with reagents such as methanol and alkylamine. With operator safety firmly in mind, reusable septum-sealed reagent vials are used. Loading and removing reagents is convenient and reliable – the vial, located in its holder, is inserted into a shielded needle using a simple bayonet fitting.

To prevent accidental damage, the high voltage lead is shielded. The plasma current is variable by adjustment of the vacuum level using an argon leak valve with the plasma voltage being preset. For maximum sputter coating efficiency, the gas injector system ensures that argon gas enters the chamber close to the plasma discharge. Venting is to argon.
**GloQube® Plus (continued)**

The primary application of the GloQube® Plus is the hydrophilization (wetting) of carbon-coated TEM support films and grids which otherwise have the tendency to be hydrophobic. Glow discharge treatment with air will make film surfaces negatively charged and hydrophilic and allow the easy spread of aqueous solutions. This and other processes are outlined below.

### Glow Discharge Typical Processes

</tbody>
</table>

* Air followed by post-treatment with magnesium acetate by the user.
** Hydrophobic, as noted above, may represent a less hydrophilic sample of less than 90 degrees contact angle.

**Recommended applications for the GloQube® Plus:**
- Hydrophilization and cleaning of TEM grids carbon support films* for better sample spreading
- Improved adhesion and orientation of proteins, nucleic acids and antibodies
- TEM grid preparation for nanoparticle studies

* These products are for Research Use Only.
* Typically: Formvar®, Lacey Carbon, Holey Carbon, Continuous Carbon, Quantifoil®

**Contact angle left:** positive discharge using methanol shows carbon grid less hydrophobic

**Contact angle right:** negative discharge using amylamine shows carbon grid surface hydrophobic

TEM images of the 20S human proteasome complexes, showing the effect of altering the surface charge of the carbon support film on the orientation of the protein. 2.5 nm of carbon film on Quantifoil® 1.2/1.3 400 mesh was used as a support for the sample.

**Carbon surface without glow discharge treatment.**
Visible some side views of the protein due to uneven charge of the surface.

**Carbon surface with air glow discharge biased top view.**
Orientation of the protein caused by uniform negative charge of the surface. Biased-top views 20S proteasome complex adsorption on in-air glow discharge modified carbon support TEM grids.

**Carbon surface with amylamine glow discharge.**
Biased side-view orientation of the protein caused by uniform positive charge on the surface.

**What is... Glow Discharge?**

Electric glow discharge is a type of plasma formed by passing a current at 100 V to several kV through a gas at low pressure (i.e. in a vacuum system). The main application of glow discharge in electron microscopy (EM) is to convert naturally hydrophobic (‘water-hating’) carbon-coated transmission electron microscopy (TEM) support grids into a hydrophilic (‘water-loving’) condition. Glow discharge treatment with air will make film surfaces negatively charged and hydrophilic and allow the easy spread of aqueous solutions.

Other treatments include:
- Hydrophobic-positive treatment in air with magnesium acetate post-treatment to allow nucleic acid adhesion to carbon films.
- Hydrophobic-positive treatment with amylamine for proteins, antibodies and nucleic acids.
- Hydrophobic-negative treatment in air for positively charged protein molecules, (e.g. ferritin, cytochrome c).

Glow discharge can also be used for modifying surface, for example, to increase bond strength of polymers.

Glow discharges are sometimes considered to be ‘imperfect’ plasmas and cannot be used to plasma etch or plasma ash specimens their use mainly being confined to altering surface energies, not the removal of bulk material.
III GloQube® Plus (continued)

**Easy Sample Loading, Fast Turnaround Times**

Each chamber can accommodate two 25 x 75 mm glass microscopes slides. Loading could not be easier using draw-style chamber doors and specimen stages. The stages are height adjustable and fitted with removable glass slide holders. For additional convenience – and to allow easy access for chamber cleaning – the stages can be completely removed.

**Vacuum, Automatic Valving and Controlled Venting**

The GloQube® Plus has automatic valving between chambers which maintains cleanliness by preventing cross-contamination. At the end of a process run, automatic soft venting to atmosphere through filtered inlets ensures TEM grids are not disturbed. The GloQube® Plus requires a single vacuum pump working in the 0.1 to 1 mbar range. A typical pump time to operational vacuum is 60 seconds.

**Touch Screen Control – Rapid Data Input, Simple Operation**

The intuitive touch screen allows multiple users to rapidly input and store preferred process “recipes”. Typical default glow discharge protocols are loaded as standard. Additionally, help files and useful maintenance data such as system on time and time since last clean are readily available to the operator. An Ethernet communications port is included for software updates.

**Start-up Screen**

**Stored Profiles**

**Selecting a New Profile**

**A Typical Process Run**
GloQube® Plus (continued)

**Specifications**

Note: The pump data is for the Pfeiffer DUO 6

**Glow Discharge Processes**

- **Plasma current**: 1-50 mA
- **HV power supply**: 30 W
- **Maximum voltage**: 800 V
- **Electrode polarity** – clean chamber: DC glow positive
- **Electrode polarity** – vapor chamber: DC glow negative

**Sample stage**

- **with location for two 25 x 75 mm (1" x 3") glass slides**

**Sample stage operational heights**

- Adjustable 12.5 mm (0.5“), 22.5 mm (0.9”), or 35 mm (1.38”)

**Pump hold time**: 0-72 hours

**Process time**: 1-600 seconds

**Safety**

- **Chamber vent inlets**: Filtered air inlets with slow vent options to minimize sample disturbance
- **On-board reagent storage**: Reagents are contained in sealed glass vials to minimize exposure to hazards
- **High voltage safety interlocks**: Hardware safety interlocked and software for process control

**Vacuum**

- **Vacuum control**: Integrated pirani gauge
- **Working vacuum range**: 0.1 to 1 mbar
- **Pump min. requirements**: 5 m³/hr, Inlet flange: KF 16.
- **Pumping time**: Typical pump time to an operational vacuum of 0.1 mbar in 60 seconds
- **Vacuum isolation**: Isolation valves to switch vacuum and prevent process chamber cross-contamination

**Dimensions**

- **Instrument size**: 336 mm H x 364 mm D x 336 mm H
- **Instrument weight**: 19.4 kg
- **Pump**: 391 mm W x 127 mm D x 177 mm H
- **Pump weight**: 16 kg
- **Footprint with pump**: 366 mm W x 600 mm D x 336 mm H

**Communications**

- **Interface**: USB
- **Power requirements**: 120 V 60 Hz, 15 A or 230 V 50 Hz, 10 A
- **Instrument power rating**: 100-240 V AC 60/50 Hz 700 VA including pump, IEC inlet
- **Pump power rating**: 115/230 V 60/50 Hz 450 W

What is Sputter Coating?

When a glow discharge is formed between a Cathode and Anode using a suitable gas (typically Argon), and Cathode target material (commonly Gold) the bombardment of the target with gas ions will erode this target material, this process being termed ‘Sputtering’. The resulting omni-directional deposition of sputtered atoms will form an even coating on the surface of the specimen. It will inhibit charging, reduce thermal damage, and improve secondary electron emission which are beneficial for Scanning Electron Microscopy. The Cathode target material is commonly Gold. However, to achieve finer grain size, and thinner continuous coatings, it is advantageous to use cathode target materials such as Chromium. To achieve sputtering with this target material requires vacuums somewhat better than those achievable with a Rotary Vacuum Pump.

Techniques and Applications

Introduction

When a target is bombarded with fast heavy particles, erosion of the target material occurs. The process, when occurring in the conditions of a gaseous glow discharge between an anode and cathode is termed sputtering. Enhancement of this process for scanning electron microscopy (SEM) sample coating is obtained by the choice of a suitable ionization gas and target material. Sputtered metal coatings offer the following benefits for SEM samples:

- Reduced microscope beam damage.
- Increased thermal conduction
- Reduced sample charging (increased conduction).
- Improved secondary electron emission
- Reduced beam penetration with improved edge resolution
- Protects beam sensitive specimens

Increase in electrical conductivity of a sample is probably the single most common requirement for SEM, though all factors come into play with FEG SEM. Low voltage SEM operation can still benefit in many cases from a thin coating. The development of Sputter Coater systems embodies significant empirical design, however, an understanding in classical terms of glow discharge characteristics enhance such designs and may assist in the comparison of differing systems.

Gaseous Condition

If an inert gas such as argon is included in a cathode gas tube, the free ions and electrons are attracted to opposite electrodes and a small current is produced. See Figure 1. As voltage is increased some ionization is produced by collision of electrons with gas atoms, named the “Townsend” discharge. When the voltage across the tube exceeds the breakdown potential, a self sustaining glow discharge occurs - characterized by a luminous glow.

The current density and voltage drop remains relatively constant, the increase in total current being satisfied by the area of the glow increasing. Increasing the supply voltage increases current density and voltage drop, this is the abnormal glow region. The current density and voltage drop remains relatively constant, the increase in total current being satisfied by the area of the glow increasing. Increasing the supply voltage increases current density and voltage drop, this is the abnormal glow region. The current density and voltage drop remains relatively constant, the increase in total current being satisfied by the area of the glow increasing. Increasing the supply voltage increases current density and voltage drop, this is the abnormal glow region. The current density and voltage drop remains relatively constant, the increase in total current being satisfied by the area of the glow increasing. Increasing the supply voltage increases current density and voltage drop, this is the abnormal glow region. 

The positive ion density in the “Crookes dark space” is very high; as a result a significant voltage drop is experienced between it and the cathode. The resulting electric field accelerates the positive ions which produce secondary electron emission from the cathode. These electrons accelerated in the direction of the anode cause ionization, generating positive...
Techniques and Applications

Ions to sustain the discharge. Subsequently, excitation of the gas results in intense illumination in the negative glow region. From this stage the electrons have insufficient exciting or ionizing energy, resulting in the “Faraday dark space”. Towards the anode a small accelerating field can produce ionization and excitation, the gas again becoming luminous. See Figure 2.

Sputter Coating

It has been indicated that under conditions of glow discharge, ion bombardment of the cathode will occur. This results in the erosion of the cathode material and is termed plasma sputtering, with the subsequent omni-directional deposition of the sputtered atoms forming coatings of the original cathode material on the surface of the sample and work chamber. This process is enhanced in sputter coaters for use in Scanning Electron Microscopy where one objective is to provide an electrically conductive thin film representative of the specimen to be viewed. Such films inhibit “charging”, reduce thermal damage, and enhance secondary electron emission.

The most common arrangement for a D.C. (Direct Current) sputter coater is to make the negative cathode the target material to be sputtered (typically gold, platinum or with high vacuum sputter coaters, metals such as chromium and iridium), and to locate the specimens to be coated on the anode (which is usually “earthed” to the system, so the specimens are effectively at “ground” potential).

The desired operating pressure is obtained by a pump (usually a two-stage rotary vacuum pump, or a turbomolecular pumped “backed” by a rotary pump), with an inert gas, such as argon admitted to the chamber by a fine control (leak) valve.

Operating Characteristics

The glow discharge in sputtering is significantly dependent on the work function of the target material and pressure of the environmental gas. A range of target materials are used including gold, gold-palladium, platinum and silver. Although gold is still a common sputtering metal, having the most effective electrical conduction characteristics, it does however, have the largest grain size and is not always suitable for high resolution coating. For this reason gold-palladium and platinum are now widely used as their grains sizes are smaller than gold. Films with even smaller grain sizes can be achieved using metals such as chromium and iridium, but both require the use of a high vacuum (turbomolecular pumped) sputtering system.

The sputter head and sputter power supply should be effective over a range of anticipated target materials.

The deposition rate is current dependant, and if we operate in the correct glow region of the characteristic plasma discharge, as previously described, several fold changes in current should be available for a relatively small change in sputtering voltage. The deposition rate should not be sensitive to small changes in pressure which may be experienced in the system.

If the sputtering head is well designed and operating at low voltage and as a result, low energy input, then radiant heating from the target and high energy electrons (potentially the most significant sources of damage to delicate specimens) should be considerably reduced. There is also evidence to suggest that such a sputter head system may also produce finer grain sizes than gold. Films with even smaller grain sizes can be achieved using metals such as chromium and iridium, but both require the use of a high vacuum (turbomolecular pumped) sputtering system.

The presence of an inert gas which will not decompose in the glow discharge is obviously desirable. Argon, having a relatively high atomic weight, provides a suitable source of ions for effective bombardment of the target material. Sputtering in air is best avoided.

The effectiveness is also dependent on the “mean free path” (m.f.p.) which is inversely proportional to pressure. If the m.f.p. is too short, insufficient energy will be gained for effective bombardment and will inhibit movement of sputtered material from the target.

If the m.f.p. is too long, insufficient collisions occur and, in addition, the flow of sputtered material may change from diffusion in the gas to free molecular flow with a reduction in the effectiveness of omni-directional deposition.

For sensitive specimens pre-cooling (Peltier, water or cryo cooled) and subsequent reduction of the baseline may still be desirable and there is also evidence to suggest a reduction in grain size of the coating. If not, however, such cooling will only serve to reduce the baseline temperature, the thermal conductivity of most specimens we are considering being relatively poor.

For sensitive specimens pre-cooling (Peltier, water or cryo cooled) and subsequent reduction of the baseline may still be desirable and there is also evidence to suggest a reduction in grain size of the coating. It may be apparent that Scanning Electron Microscopy requires a versatile system without compromising performance. Specifically, fine grain size, uniform coating and low heat input. Consideration of these characteristics in design and development should enable a suitable coating system to be realised.

A major disadvantage of simple diode sputter coaters in SEM is the excessive amount of heat generated in the sample. To overcome this problem, permanent magnets are utilized to deflect the high energy electrons generated in the glow discharge away from the sample. The magnetic lines of force cause enclosed loops at the target surface.
Techniques and Applications

Increasing the interaction path length of the high energy electrons in the discharge. Deflection and retardation of electrons result in increased ion yield and sputtering efficiency. It was indicated previously that while empirical design may be in evidence, it should now be apparent that effective production of positive ions for glow discharge is required. The sputter head and its associated power supply should be a primary objective of design and development.

All modern SEM sputter coaters use heads fitted with an arrangement of magnets and often an associated shroud assembly, with a disc target. Power supplies generally employ solid state switching for applied voltage control. See Figure 3.

The overall result is a low mean voltage head with low energy input. The possibility of thermal damage due to radiant heating and electron bombardment is considered negligible. For a typical modern magnetron sputter coater:

- **Vacuum**: $8 \times 10^{-1}$ to $2 \times 10^{2}$ mbar
- **Sputtering Voltage**: 100V to 3Kv
- **Current**: 0 to 50mA
- **Deposition**: 0 to 25 nm/min
- **Grain size**: Less than 5nm
- **Temperature rise**: Less than 10°C

It is, of course, possible to satisfy very precise parameters by the selection of target material, ‘voltage’ ‘deposition’, ‘current’ and ‘vacuum’. Under these conditions, it is possible to achieve thin films to 10nm with grain sizes better than 2nm and temperature rises of less than 1°C.

**Choice of Sputtering Material**

As stated many times, metal coating is an indispensable technique for SEM. The development of high resolution FEG SEMs has brought about more widespread use of specialized techniques such as Ion Beam Sputtering, Penning Sputtering, E-Beam Evaporation and Planar magnetron ion-sputtering.

More lately Chromium coating has become the "fashionable" material to use. It offers a thin continuous film and emits less back scattered electrons than other sputter materials. However it is not free of its own problems. To operate it requires a high vacuum and ideally vacuum transfer (or vacuum storage) of the sample to avoid oxidation problem. Cr coated samples may often have a "see through" look as there is the possibility of images generated from electrons from sub-surface structures. More recently iridium films have been shown to give excellent fine grain (sub nanometer) films that compare favorably with those generated with Cr. Both metals require high vacuum sputter coaters for effective deposition.

Application data collected has shown that a high quality well designed rotary pumped magnetron sputter coater, such as the EMS 550X, is capable of producing a continuous Pt (platinum) film with a grain size in the order of 2 nm. It also has the benefit of being a good secondary electron emitter, unlike chromium. Some images of chromium show bright high contrast images. Many workers, and our own studies have led us to consider the possibility of each grain of chromium being oxidised before sample is coated and hence the film is not truly continuous and indeed each metal grain is individually charging. This is another reason to consider iridium as an alternative.

Silver as a sputter material is often ignored but is a very satisfactory method for ensuring conductivity of the SEM sample but has a major advantage the whole process is reversible as the metal may be removed by the neutral aqueous reagent known as "Farmers reducer". This enables many samples to be viewed and then returned to their original condition. Beware...

Silver may form crystalline deposits on the surface of the sample in the presence of active Halogens

- Sputtered silver offers smaller grain size than evaporated silver.
- Sputtered Gold and Silver have similar grain size but the silver has larger reticulation after storage.
- Silver is the most conductive metal known.
- Silver has a high secondary electron coefficient.
- X-ray emission lines are well separated from the biologically important sulphur and phosphorous.
- Cost effective.

Gold/Palladium (80:20) targets are now a popular standard choice for the routine coating of a wide range of samples. The idea behind using this alloy is that the palladium will act as a physical barrier to the gold which will attempt to conglomerate into large islands and restrict ultimate resolution performance.

The minimal loss in secondary electron emission performance from the palladium is not seen as significant with current SEMs.

Other target choices are generally made based on the requirement for X-ray analysis of samples or back scattered electron detection.

Techniques and Applications

Rates of Sputtering

A question regularly asked is what difference is there in sputtering rates for each of the target materials. The following list gives the variance of the materials in relation to gold, assuming gold to be 1, it is impossible to give actual coating rates as this varies with sputtering conditions.

Thickness of Coating

Experiments using interferometric techniques have shown that the thickness of Au/Pd coating sputtered in argon gas can be calculated at 2.5KV according to:

\[
T_h = 7.5 \times I \times t \text{ (angstroms)} \quad (V = 2.5KV, \text{ target to specimen distance} = 50mm)
\]

\(I\) = current in mA

\(T_h\) = thickness in angstroms

Average coating times will be of the order of 2-3 minutes using \(V = 2.5KV\) and \(I = 20\ mA\). Platinum targets when fitted will give approximately half the deposition rate.

General Points for Improving Performance

1. Cleanliness, the work chamber must be kept clean! We advise that a separate carbon coater be used in applications where the maximum performance of the sputter coater is required.
   - Clean the glass chamber with hot soapy water and dry thoroughly, solvents can be used but we have found this unnecessary and having greater danger to health and safety. If the deposit is stubborn, use a kitchen scouring pad such as the green Scotch Bright variety.
   - Use Isopropyl alcohol on metal surfaces, not acetone which has greater danger to health and safety. It will also take longer to out gas and reduce the vacuum performance.

2. Vacuum, Never leave the chamber under vacuum without isolating the roughing pump from the coater, this is usually done with a manual valve (Quorum high vacuum sputter coaters have useful “pump hold” facility that allows the vacuum chamber to be held under vacuum when the instrument is not in use). Failure to do so will increase the risk of suck back of hydrocarbons (pump oil) in to the sputter chamber and increase contamination.
   - Always ensure the system is dry and pumping to its correct vacuum level before working with samples, failure to do so will result in poor sputter rate and contamination.
   - Ballast rotary pumps on a regular basis and ensure they are serviced at regular intervals.

3. Sputter gas, Always use high purity argon gas of the grade known as “White spot” this will ensure fast sputter rate and good pump down time.

4. Rotary planetary specimen stages are essential for ensuring even coatings on specimens with irregular surfaces.
Techniques and Applications

Silver as a removable coating for scanning electron microscopy

Acknowledgement: The following abstract and method results (introduction only) is reproduced by kind permission of A.A. Mills, Scanning Microscopy, Vol. 2, No.3, 1988 (Pages 1265-1271)

Abstract

A thin film of silver, applied by sputtering or vacuum evaporation, provides an excellent conformal conductive coating for scanning electron microscopy of insulating specimens. When no longer required it is easily removed with Farmer’s Reducer - a dilute aqueous solution of potassium ferricyanide and sodium thiosulphate. No damage was apparent to fine structure in the calcite matrix of oyster shells, or to other biological tissues. No problems have been encountered with grain in the silver film at magnifications up to x15,000, or in the storage of coated specimens in a desiccator for periods exceeding six months.

Introduction

Many specimens for which scanning electron microscopy (SEM) is invaluable are electrical insulators, for example microfossil and dried biological preparations. To promote the emission of secondary electrons, and to prevent charging of the surface (with consequent repulsion of bath incoming and secondary electrons) it is usual to coat such specimens with a very thin layer of metal.

Nowadays gold (sometimes over a thin undercoat of carbon) is commonly employed for the majority of work, although refractory metals have been recommended for the very highest magnifications. These coatings are normally applied by sputtering in a glow discharge, for this technique is omni-directional and tends to give a fine-grained deposit, while the apparatus required is comparatively simple and inexpensive since a high vacuum is not required. An alternative, older technique (which also allows aluminium to be deposited) is evaporation of a molten bead of the chosen metal in a high vacuum. The inherent directionality of this method means that specimens must generally be moved continuously by a rotating/rotating table. Problems arise when it is desired to return a specimen to its original uncoated condition, for example to allow successive treatments or because too thick a coating has been accidentally applied. Even specimens which have been correctly coated may be rendered unsuitable for subsequent optical and analytical examination, due to the highly reflective nature of the gold film and its interference with x-ray emission. For these reasons there is frequently a reluctance to allow SEM examination of certain material, eg type specimens and archaeological artifacts.

Removal of Gold and Aluminum Coatings

Attempts have therefore been made to remove the metal film by suitable reagents, which must obviously not attack the substrate. It is well-known that gold is recovered from siliceous ores by complexing with aqueous cyanide under oxidizing (aerobic) conditions, and two groups have independently utilized this reaction. A major obstacle is the highly toxic nature of cyanides, necessitating efficient fume hoods and a high degree of supervision and control unwanted in most laboratories. A less objectionable reagent is ferric chloride in alcohol, but it requires some six hours on a gold/palladium film from a smooth PTFE surface, and appears likely to attach many specimens. Mercury amalgamates gold, but does not remove it completely and adds its own background. Aluminum dissolves in weak acids and alkalies with the evolution of hydrogen. Sylvester and Bradley therefore hoped that soaking in a dilute solution of sodium hydroxide would enable this metal to be removed from calcite microfossils without damage to the matrix. Unfortunately, they were later obliged to acknowledge that insufficiently careful exposure to alkali could result in dissolution of fine structure.

Advantages of a silver film

Silver would appear to have much to commend it as an alternative to gold. It is the most conductive metal known, possesses a high secondary electron coefficient, and is readily applied by sputtering or evaporation to follow irregular contours better than any other material. Unlike gold, its x-ray emission lines are well-separated from those of the biologically important sulphur and phosphorus. Its cost is only a fraction of gold and the platinum metals. The unique applicability of silver to photography has resulted in extensive research upon its complex ions and their solubility.

Method of removing gold

One of the mildest of these ‘reducers’ is that formulated by Farmer in 1884, employing very dilute potassium ferricyanide as the oxidizing agent. As paper, albumen and gelatine were apparently unaffected, it was thought that this reagent might well prove suitable for dissolving silver from a variety of coated specimens without damage to the matrix. Ferricyanides do not possess the extreme toxicity of the simple cyanides, and may be purchased and used in the same way as ordinary laboratory and photographic chemicals.

Farmer’s Reducer - the formulation used is based on that given by Jacobson:

Solution A
25g sodium thiosulphate (crystals)
250ml water
2 drops of Kodak ‘Photoflo’

Solution B
10g potassium ferricyanide
100ml water

These solutions appear to be stable indefinitely at room temperature if kept in securely stoppered amber glass bottles. Immediately before use, the following mixture is to be prepared:

50ml water
50ml Solution A
3ml Solution B

Quite early in the history of photography it was found that a dark, over-exposed negative could be rendered less opaque (‘reduced’) by aqueous oxidizing agents in the presence of sodium thiosulphate. The metallic silver forms the Ag ion, which is promptly complexed by the thiosulphate so that still more silver dissolves. No gas is evolved. The negative would be removed from the reagent and thoroughly washed when a sufficient amount of silver had been abstracted from the image.
Techniques and Applications

It was found that the resulting pale yellow solution had a pH of about 5, the same as the CO2-equilibrated tap water used for its preparation. It was unstable, losing activity and color after about two hours at room temperature. A neutral mixture may be prepared by substituting pH 7 phosphate buffer (conveniently prepared from a BDH tablet) for water in the above dilution. However, all the tests to be described in the paper were conducted with the ordinary solution prepared with tap water.

It should be noted that calcium carbonate has a significant solubility in water. In nature, calcite microfossils are protected against percolating groundwater by the sacrificial dissolution of fossils above and around them. Once removed from this environment to the laboratory, such fossils should presumably be washed only with distilled water that has been allowed to stand in contact with CaCO (eg marble chips) and filtered. Otherwise needles and similar fine structures will be particularly at risk.

This equilibrated ‘hard’ water could be used to prepare and dilute the Farmer’s Reducer. A very brief final rinse in distilled water is probably permissible; the common practice of ‘soaking overnight’ is not.

Results — silver mirror on glass

A silver mirror was made by evaporating the metal on to a microscope slide cleaned with chromic acid. Sufficient was deposited to give a semi-transparent film: silvery when placed on a dark background and viewed by reflected light, but behaving as a blue filter when examined by transmitted light.

The coated glass slide was immersed in freshly-prepared Farmer’s Reducer. The silver was gently dissolved in a controlled manner, as shown by the gradual and uniform loss of color in transmitted light, until none remained after three minutes. No gas was evolved. It was decided that a 10 minute immersion should allow an ample margin to deal with specimens with convoluted surfaces. The reagent had no effect upon gold films. Alloys of silver and gold have not been investigated.

### Comparative Sputter Data

#### Iridium and other materials

Samples were coated using an EMS 575X Sputter Coater and were examined using a Hitachi S-5200 Field Emission SEM.

The use of carbon films in Electron Microscopy with their low background signal and relatively good electrical conductivity is well known. Thin films, nominally 5nm or 50 Angstroms, are used in TEM, while a range of somewhat thicker films, ranging from 50nm or 500 Angstroms, may be used in SEM for such applications as X-ray microanalysis. Commonly, a high vacuum evaporator with carbon rods is used to achieve these coatings, and still has preferential applications. The use of carbon fiber however, has allowed a flash evaporation technique to be developed which can be suitable for a number of general EM requirements.

Pinus sylvestris (Scots pine)
Transverse image shows the latewood portion of the growth ring. This surface shows latewood tracheids (transportation and structural cells) and also part of a ray (cells for storage of food substances). EDX spot analysis of the wood specimen using Oxford Instruments’ INCA Energy shows a small chlorine peak, which results from treatment of the wood with a preservative - shown in the graph. The specimen changes excessively unless carbon coated. Other types of coating cannot be used due to the very low levels of chlorine used in the preservative, with which the wood is treated. With thanks to Oxford Instruments.

Section A. Preparation of normal carbon support films
NOTE: Processes use a diffusion-pumped vacuum evaporator, for turbomolecular-pumped systems please modify the process as appropriate. For optimum results, vacuum levels in the range of 5x10^-11 mbar or better are recommended.

Step 1. Copper grids should be pre-cleaned by sonicating for 10 seconds in acetone, followed by 10 seconds of sonication in ethyl alcohol. Allow grids to dry on filter paper in a dust-free environment before use.

Step 2. Add 0.12g of formvar powder to 50ml of ethylene dichloride and mix well on a magnetic stirrer until dissolved. Pour the solution into a clean coplin jar.

Step 3. Clean a glass slide with water and detergent. Rinse well to make sure that all of the detergent is removed and finally rinse in de-ionized water before drying with a paper towel. Blow off any lint on the slide with compressed air. Place the slide in a dry, dust-free environment such as on filter paper under an upturned beaker. If there are problems in getting the plastic film to be released from the slide (Step 5), using a slide that has not been as thoroughly cleaned might help.

Step 4. Dip the cleaned slide into the formvar solution (step 1 in picture) and touch edge to filter paper to drain off the excess fluid (step 2 in picture). Dry upright in a dust-free environment (this requires 5-10 minutes).

Step 5. Score the edges of the formvar film with an acetone-cleaned razor blade (step 3 in picture). Breathe on the slide to loosen the film, and slowly slide off on a clean water surface by immersing the slide into the water at a -15° angle (step 4 in picture). Place grids, dull/rough surface down, onto good (uniform, grey color, un-wrinkled) areas of the film. Place a small piece of clean, white paper onto the surface of the grids and film and allow the paper to soak up water. Pick up the paper, grids and film and place in a covered petri dish to dry.

Step 6. Carbon coat film according to directions (see Section C) to desired thickness - a light-brown color indicates a thickness of 100Å.

Step 7. Place the paper and coated grids onto a piece of filter paper that is soaked with ethylene dichloride in a covered petri dish. 30 minutes should be sufficient time to dissolve the Formvar film and not damage the carbon support. Remove the grids and paper and allow them to dry in a dust-free area.

Section B. Preparation of perforated carbon support films
Step 1. Copper grids should be pre-cleaned by sonicating for 10 seconds in acetone, followed by 10 seconds of sonication in ethyl alcohol. Allow grids to dry on filter paper in a dust-free environment before use.

Step 2. Add 0.17g of formvar powder to 50ml of chloroform and mix well on a magnetic stirrer until dissolved. Pour the solution into a clean coplin jar.

Step 3. Clean a glass slide with water and detergent. Rinse well to make sure that all of the detergent is removed and finally rinse in de-ionized water before drying with a paper towel. Blow off any lint on the slide with compressed air. Place the slide in a dry, dust-free environment such as on filter paper under an upturned beaker. If there are problems in getting the plastic film to be released from the slide (Step 6), using a slide that has not been as thoroughly cleaned might help.

Step 4. Add about 50 drops of a 50% glycerol/water solution to the surface of the formvar solution. Place the tip of a probe sonicator onto the surface of the solution and sonicate until mixed. Sonication intensity should be great enough to ‘violently’ cause the solution to bubble. This often requires not much more than about five seconds. This should produce numerous holes that are 1-2μm in diameter and suitable for use with frozen-hydrated specimens. Sonication for longer periods of time produces smaller holes in the film.
Techniques and Applications

Section C. Use of a shadow evaporator for carbon coating plastic films

Step 1. Turn shadow evaporator on: Turn both the main and mechanical pump switches on. Move the black-knobbed manifold valve handle downwards to ‘backing’ position. Open the air inlet valve and CAREFULLY remove the implosion shield and bell jar. Set the bell jar upside down on the rest on the adjacent cabinet.

Step 2. Set up carbon coating apparatus: Plug one lead to ground (‘E’) and the other to ‘1’ (see second diagram). Remove the cylindrical glass shield. Release the tension spring that holds the right carbon rod in place and remove the rod. File the edge of the left carbon rod flat with a piece of emery cloth. Replace the right rod with a fresh one or sharpen it by the procedure described below.

Step 3. Carbon rod sharpening procedure: Place the carbon rod in the chuck of the sharpener. Pull the rod out until its edge is aligned with the edge of the aligning arm and then tighten the chuck. Turn on the sharpener and run the first sharpening tool against the rod until a conical point is formed. Then run the second tool against the rod until a narrow point is formed. Turn off the sharpener and clean off all carbon dust. Put the newly sharpened rod in the chuck of the carbon coater and tighten. Replace the tension spring and then the glass shield.

Step 4. Set up grids: Place the grids and paper support on a piece of filter paper on top of the base of the carbon coating apparatus (see second diagram). Place a thumbtack alongside the slide. This provides a ‘shadow’ on the filter paper and helps you determine the relative thickness of the carbon coating.

Step 5. Diffusion pump warm up: Replace the bell jar and the implosion shield. Close the air inlet, and move the manifold valve handle slowly upwards to the roughing position. Allow the vacuum to reach 0.04 Torr on the bell jar gauge and then move the handle downwards to backing.

Step 6. Obtaining a high vacuum: Move the manifold valve handle slowly upwards to the roughing position and allow the vacuum to reach 0.04 Torr on the bell jar gauge. While waiting for the vacuum to recover, fill the baffle with liquid nitrogen. When the bell jar vacuum has reached 0.04 Torr, move manifold valve handle down to the backing position. Depress the metal guard beneath the red mains valve knob and move the knob handle upwards to the open position Allow the vacuum to reach a minimum of 2x10^-5 Torr or better.

Step 7. Carbon coating: Turn the electrode selector to #1. Turn the electrode switch on. Slowly turn the electrode current control knob until there is a slight glow at the point where the two carbon rods meet. Slowly increase the current until the rods become white hot. The proper current setting should be just before the point where the carbon starts to sputter. Frequently monitor the thickness of the carbon by turning down the current, checking the darkening of the filter paper and then turning the current back up again.

Step 8. Diffusion pump cool down: Turn down the electrode current control knob and turn off the electrode switch. Make sure the manifold valve is set to the backing position and close the mains valve. Open the air inlet, remove the implosion shield and bell jar and remove the grids. Then replace the bell jar and implosion shield, close the air inlet and move the manifold valve handle to the roughing position. Allow the vacuum to reach 0.04 Torr on the bell jar gauge, move the manifold valve handle to the backing position, turn off the diffusion pump, and allow the pump to cool for 20 minutes.

Step 9. Turn shadow evaporator off: Close the manifold and turn off the mechanical pump and main power switches. Turn off the cooling water.

Section D. Glow discharging carbon films

Step 1. NOTE: Place the very edge of your carbon coated grids along the edge of a piece of double-sided tape on a glass slide. This will help to prevent your grids from flying around inside the shadow evaporator when the air release switch is opened.

Step 2. Turn shadow evaporator on: Turn on mechanical pump and move the manifold valve handle (black knob) downwards to the backing position. Open the air inlet. CAREFULLY remove the implosion shield and bell jar.

Step 3. Set up glow discharge unit: Plug the lead into the proper receptacle (BNC connector). Place the glass slide with your grids on the unit and replace the bell jar and implosion shield. Close the air inlet, turn the butterfly switch by the current gauges to glow discharge and move the manifold valve handle slowly upwards to the roughing position. Allow the vacuum to reach 0.2-0.15 Torr on the bell jar gauge. Make sure the manifold valve is set to the backing position if the vacuum rises above 0.10 Torr.

Step 4. Glow discharging: Turn the electrode selector to position #1 and turn the electrode switch on. Slowly turn up the electrode current control knob and the electrode switch. Move the manifold valve handle to the backing position. Turn the butterfly switch back to the evaporator setting.

Step 5. Turn shadow evaporator off: Slowly open the air inlet to prevent your grids from being blown around the bell jar. Remove the grids, replace the shields and then close the air inlet. Move the manifold valve to the roughing position. Allow the vacuum to reach 0.04 Torr on the bell jar gauge before moving the manifold valve handle to the horizontal (closed) position. Turn off the mechanical pump and the main switch.
**Selection Guide: Q Series Sputter Coaters, SEM/TEM Carbon Coaters**

If you are not sure which coating system suits your application’s requirements please don’t hesitate to contact us for advice.

MiniQS Entry-Level Sputter Coater

QUICK OVERVIEW
The MiniQS is ideal for the budget-conscious user who also demands reproducible results in an easy-to-use instrument. The MiniQS uses a Magnetron sputtering head with an easily replaceable disc target.

KEY FEATURES
- Sputter head is hinged for easy operation
- Fitted with safety interlocks
- Detachable chamber with implosion guard and top-plate, allowing for easy cleaning
- Pre-set profiles with single touch operation
- Automatic operation with minimal user intervention required
- Compact size; ideal for use with benchtop SEMs
- Range of noble target options to suit majority of applications including forensics
- Possibility of coating samples up to 50 mm diameter

Safety
The MiniQS meets UK and European (CE) industry standards, including LVD, EMC and RoHS. Vacuum interlocks remove power from deposition sources to prevent users being exposed to high-voltage.

SPECIFICATIONS
Instrument Dimensions 225 mm W x 420 mm D x 480 mm H x 470 mm
(total height with coating head open)
Weight 8.7kg
Sputter Target Disk-style 57 mm dia. 0.1mm thick gold (Au) target is included in the accessory pack. Gold/palladium (Au/Pd) and silver (Ag) target options available.
Specimen Stage 50 mm dia. stage
Vacuum (two options available) Long Pipe Option: Suitable for placing rotary pump on the floor (1.5m KF16 stainless steel, average pump down 31.57 sec.)
Short Pipe Option: Suitable for pump to be housed on bench or below bench (0.7m Armorvin hose, average pump down 53.60 sec.)

ORDERING INFORMATION
Cat No. Description Qty.
MiniQS MiniQS Entry-Level Sputter Coater each

Recommended applications for MiniQS Entry-Level Sputter Coater:
- Table-top SEM coating
- Low and medium magnifications
These products are for Research Use Only.
QUICK OVERVIEW

The Q150R Plus is suitable for use with Tungsten/LaB₆ SEM and Benchtop SEM.

Typical uses

Sputter coating of noble metals using the Q150R S Plus & Q150R ES Plus

Recommended for magnifications:
- Up to x 50k using Au, Au/Pd
- Up to x 100k using Pt (optional)

Carbon cord coating for elemental analysis using the Q150R S Plus & Q150R ES Plus.

KEY FEATURES

- Capable of achieving vacuum of 2 x 10⁻³ mbar
- New touch and swipe capacitive screen
- USB port for upgrades and download of log files
- Multiple-user profiles can be set up on one machine
- New software sorts recipes per user, according to recent use
- 16GB of memory can store more than 1000 recipes
- New multi-color LED visual status indicator
- Interchangeable stage options and plug-in heads

PRODUCT DESCRIPTION

The Q150R Plus is available in three configurations:
- Q150R S Plus – An automatic sputter coater for non-oxidizing metals. Available sputtering targets including gold, gold/palladium and platinum.
- Q150R E Plus – An automatic carbon cord coater for SEM applications such as EDS and WDS.
- Q150R ES Plus – A combined system system capable of both sputtering and carbon coating. The deposition heads can be swapped in seconds.

Improved Interface

- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help screen
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Dual-core ARM processor for a fast, responsive display

Allows multiple users to input and store coating recipes, with a new feature to sort recipes per user according to recent use. Intelligent system logic automatically detects which insert is in place and displays the appropriate operating settings and controls for that process. System prompts user to confirm target material and it then automatically selects appropriate parameters for that material. Intuitive software allows the most inexperience or occasional operator to rapidly enter and store their own process data. For convenience a number of typical sputtering and carbon coating profiles are already stored but also allows the user to create their own.

Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.

Automatic, controlled pulsed carbon cord evaporation

The carbon evaporation process can be terminated using the optional film thickness monitor, which incorporates a quartz crystal monitor, fitted as standard on E and ES models. This recipe ensures that carbon is evaporated in short controlled pulses, which has two effects: protecting the sample from heating and ensuring the accuracy of the film thickness monitor. Pulsing also significantly reduces the amount of debris (including large carbon fragments) associated with traditional carbon “flash” evaporation. Pulsed and ramped carbon rod recipes are supplied as standard.

Cool Magneton Sputtering

Sputter coating is a technique widely used in various applications; it is possible to create a plasma and sputter metals with high voltage, poor vacuum and no automation. However, this is not suitable for electron microscopy applications because it will heat the sample and can result in...
**III Q150R Plus (continued)**

damage when the plasma interacts with the sample. The Q150R Plus series uses low temperature enhanced-plasma magnetrons optimized for the rotary pump pressures, combined with low current and deposition control, which ensures your sample is protected and uniformly coated.

The Q150R S Plus and Q150R ES Plus use easy-change, 57 mm diameter, disc-style targets which are designed to sputter non-oxidizing (noble) metals – ideal for W-SEM applications. The Q150R S Plus and Q150R ES Plus are fitted as standard with a gold (Au) sputter target.

Other targets options include Au/Pd, Pt/Pd, Pd, and Cu. Platinum (Pt) can also be sputtered with the optional Pt coating vacuum hose assembly.

**Interchangeable Plug-in Heads**

This allows the user to configure the system as a sputter coater, evaporator or glow discharge system – all in one space saving format. A carbon cord evaporation insert is available as an option. Automatic detection of the head type when changed.

**Detachable chamber with built-in implosion guard**

Removable glass chamber and easily accessible base and top plate allows for an easy cleaning process.

Users can rapidly change the chamber, if necessary, to avoid cross contamination of sensitive samples.

Tall chamber option is available for carbon evaporation to avoid sample heating, to improve uniformity for sputtering and to hold taller samples.

**Multiple stage options**

The Q150R Plus has specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except for the rotary planetary stage). Some examples:

- Rotation stage (supplied as standard): 50 mm Ø can accommodate six standard stubs. Height can be pre-set.
- Rotate-tilt stage for improved uniform coating: 50 mm Ø. Tilt and height can be pre-set.
- Variable angle, rotary planetary stage for heavily contoured samples
- Large flat rotation stage with offset gear box for 4”/100 mm wafers
- Rotation stage for glass microscope slides

Other options are available on request.
Q150R Plus (continued)

**Safety**
The Q150R Plus meets key industry CE standards:
- All electronic components are protected by covers
- Implosion guard prevents user injury in event of chamber failure
- Vacuum interlocks remove power from deposition sources to prevent user exposure to high voltage in event of chamber being opened
- Electrical interlocks remove power when source head cover opened
- Overheating protection shuts down power supply

### Specimen Stage
50 mm Ø rotation stage with rotation speed of 8-20 rpm. Other stages available on request.

### Vacuum
- **Rotary Pump**: Optional 5 m³/hr two-stage rotary pump with oil mist filter (order separately)
- **Vacuum Measurement**: Pirani gauge
- **Ultimate Vacuum**: 2 x 10⁻² mbar
- **Typical ultimate vacuum of the pumping system in a clean instrument after pre-pumping with dry nitrogen gas**
- **Sputter Vacuum Range**: Between 7 x 10⁻² and 1 x 10⁻¹ mbar for gold

### Processes
- **Sputter Deposition Current**
  - Single target: 1 - 140mA
  - All targets: 60 - 420mA
- **Visual Status Indicator**: A large status multi-color indicator light provides a visual indication of the state of the equipment, allowing users to easily identify the status of a process at distance.

The indicator LED shows the following states:
- Initialization
- Process running
- Idle
- Coating in progress
- Process completed
- Process ended in fault condition

Audio indication also sounds on completion of the process.

### Options and Accessories

#### Rotary Pump Requirements—Order Separately

| 91003 | 5m\(^2\)hr two-stage Pfeiffer Due 6 rotary pump with oil mist filter | each |

#### Head Inserts and Glow Discharge

| 4511 | Additional sputter insert for quick metal change (R E and R ES only). Note: this is an entire sputtering assembly—individual noble metal targets can also be purchased | each |
| 4512 | Carbon rod evaporation insert for 3.05 mm Ø rods (R E and R ES only). Includes manual rod shaper and 3.05 mm Ø carbon rod | each |
| 4513 | Glow discharge insert to modify surface properties (e.g. hydrophobic to hydrophilic conversion) or to clean surface residues (R S and R ES only). Can be retrofitted | each |
| 4514 | Additional standard glass chamber assembly | each |
| 4515 | Extended height vacuum chamber (214 mm high – the standard chamber is 127 mm high). For increased source to sample distance and for coating large specimens | each |
| 4516 | Rotating vacuum spigot allows more convenient connection of the vacuum hose to the rear of the Q150R when bench depth is limited | each |
| 4517 | Film thickness monitor (FTM) attachment. Consists of a built in chamber mounted quartz crystal oscillator (includes crystal). As sputtered or evaporated material is deposited onto the crystal, so its frequency of oscillation is modified. This "modification" is used to measure and control the thickness of material deposited | each |
| 4518 | Spare quartz crystal | each |
| 13530 | Standard coating shield assembly | each |
| 11880 | Extended height coating shield assembly | each |
| 1371 | Platinum coating vacuum hose assembly | each |

#### Specimen Stages

| 4519 | 50 mm Ø rotate-tilt specimen stage with adjustable tilt (up to 90 degrees) and height (37 mm-60 mm). Has six stub positions for 15 mm or 6.5 mm or 1/8" pin stubs. Stage rotation speed variable between 8 and 20 rpm | each |
| 4520 | 90 mm Ø rotating specimen stage for glass microscope slides (up to two x 75 mm x 25 mm slides). Stage rotation speed variable between 8 and 20 rpm | each |
| 4521 | Variable angle "Rotacota" rotary planetary stage with 50 mm Ø specimen platform. Has six stub positions for 15 mm or 6.5 mm or 1/8" pin stubs. Stage rotation speed variable between 8 and 20 rpm | each |
| 4522 | Flat rotation specimen stage for 100 mm/4" wafers, includes gearbox for increased coverage. Stage rotation speed variable between 8 and 20 rpm | each |
| 23850 | Tilt stage sub-assembly 4° | each |

For our complete selection of specimen stages, please see the Specimen Stage Selection Guide on page 49.

### Carbon Supplies

| 4538 | Carbon fiber cord – high purity – 1m | each |
| 4539 | Carbon fiber cord – high purity – 5m | each |
| 4540 | Carbon fiber cord – standard grade – 1m | each |
| 4541 | Carbon fiber cord – standard grade – 10m | each |
| 4542 | Carbon fiber cord – standard grade – 100m | each |
| 4543 | Carbon rods – 3.05 mm Ø x 50 mm length (shaped) pack of 10 | each |
| 4544 | Carbon rods 3.05 mm Ø x 300 mm length (unshaped) pack of 10 | each |
| 4546 | Manual rod shaper for 3.05 mm Ø carbon rods | each |
| 12097 | Wedge Tool | each |

### Sputtering Targets

| 4523 | 57 mm Ø x 0.1 mm Gold | each |
| 4524 | 57 mm Ø x 0.2 mm Gold | each |
| 4525 | 57 mm Ø x 0.3 mm Gold | each |
| 4526 | 57 mm Ø x 0.1 mm Gold/Palladium (80/20) | each |
| 4527 | 57 mm Ø x 0.2 mm Gold/Palladium (80/20) | each |
| 4528 | 57 mm Ø x 0.3 mm Gold/Palladium (80/20) | each |
| 4529 | 57 mm Ø x 0.1 mm Platinum | each |
| 4530 | 57 mm Ø x 0.2 mm Platinum | each |
| 4531 | 57 mm Ø x 0.3 mm Platinum | each |
| 4532 | 57 mm Ø x 0.1 mm Nickel | each |
| 4533 | 57 mm Ø x 0.1 mm Silver | each |
| 4534 | 57 mm Ø x 0.1 mm Palladium | each |
| 4535 | 57 mm Ø x 0.1 mm Copper | each |
| 4536 | 57 mm Ø x 0.1 mm Platinum/Palladium (80/20) | each |
| 4537 | 57 mm Ø x 0.3 mm Platinum/Palladium (80/20) | each |

### Spare Kits

| 4547 | Two-year spares kit for Q150R S includes: 57 mm Ø x 0.1 mm gold target, standard glass chamber assembly quartz crystals, O-rings | each |
| 4548 | Two-year spares kit for Q150R E includes: carbon fiber/cord, standard glass chamber assembly, quartz crystals, O-rings, springs | each |
| 4549 | Two-year spares kit for Q150R ES includes: 57 mm Ø x 0.1 mm gold target, carbon fiber/cord, standard glass chamber assembly, quartz crystals, O-rings, springs | each |
QUICK OVERVIEW
The Q150T Plus is optimized for use with a turbomolecular pump, which gives a lower vacuum down to $5 \times 10^{-5}$ mbar. This enables the sputtering of oxidizing metals, which have a lower grain size suitable for high-resolution imaging. Similarly, lower scattering allows for high purity, amorphous carbon films of high density.

Typical uses
Sputter coating of noble and oxidizing metals using the Q150T S Plus & Q150T ES Plus:
Recommended for magnifications:
• Up to x 50k using Au, Au/Pd
• Up to x 100k using Pt
• above x 100k using Cr, Ir(optional)
Ideal for thin film applications such as coating with ITO, W, Al, Zn.

KEY FEATURES
- New touch and swipe capacitive screen
- USB port for upgrades and download of process log files
- Multiple-user profiles can be set up on one machine
- New software sorts recipes per user according to recent use
- 16GB of memory can store more than 1000 recipes
- New multi-color LED visual status indicator
- Capable of achieving vacuum of $5 \times 10^{-5}$ mbar

PRODUCT DESCRIPTION
The Q150T Plus is available in three configurations:
- Q150T S Plus – An automatic sputter coater for non-oxidizing metals. Sputtering targets include: Cr, Ir, W, ITO, Al. Other targets available.
- Q150T E Plus – An automatic carbon cord coater for SEM applications such as EDS and WDS. Metal evaporation/aperture cleaning option available.
- Q150T ES Plus – A combined system system capable of both sputtering and carbon coating. The deposition heads can be swapped in seconds. Metal evaporation/aperture cleaning option available.

Improved Interface
- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help screen
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Dual-core ARM processor for a fast, responsive display
- Allows multiple users to input and store coating recipes, with a new feature to sort recipes per user according to recent use.
Intelligent system logic automatically detects which insert is in place and displays the appropriate operating settings and controls for that process.

Recommended applications for Q150 T Plus:
- High-resolution magnification SEM
- Protective platinum layers for FIB
- R&D of corrosion-, friction-, and wear protective layers
- Protective layers on medical devices
- BSE imaging
- EDX, WDS, EBSD analysis
- Carbon coating of replicas

These products are for Research Use Only.

Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.

Controlled ramped carbon rod evaporation
Careful evaporation allows precise control of carbon thickness (with or without the optional film thickness monitor). The quality of the resulting carbon films is also enhanced by the eradication of “sparking” that is a common feature of less advanced coaters.

For reproducible high-quality carbon films, we would recommend the use of shaped carbon rods. Rods are higher purity, less susceptible to debris and easier to control. Pulsed and ramped carbon rod recipes are supplied as standard.
Q150T Plus (continued)

Cool Magnetron Sputtering

Sputter coating is a technique widely used in various applications; it is possible to create a plasma and sputter metals with high voltage, poor vacuum and no automation. However, this is not suitable for electron microscopy applications because it will heat the sample and can result in damage when the plasma interacts with the sample. The Q150T Plus series uses low temperature enhanced-plasma magnetrons optimized for the rotary pump pressures, combined with low current and deposition control, which ensures your sample is protected and uniformly coated.

The Q150T S Plus and Q150T ES Plus use easy-change, 57 mm diameter, disc-style targets which are designed to sputter oxidizing and noble metals. The Q150T S Plus and Q150T ES Plus are fitted as standard with a chromium (Cr) sputter target. Other targets options include Au, Au/Pd, Pt/Pd, Pd, Pt, Cu, Ir, W, ITO and Al. Others are available on request.

Pulsed cleaning for Aluminum sputtering

Aluminum (Al) rapidly forms an oxide layer which can be difficult to remove, but the Q150T ES Plus & Q150T S Plus have special recipes for Al that reduce the oxide removal time and prevent excessive pre-sputtering of the target.

Interchangeable plug-in heads

This allows the user to configure the system as a sputter coater, evaporator or glow discharge system – all in one space saving format. A carbon cord evaporation insert is available as an option. Automatic detection of the head type when changed.

Detachable chamber with built-in implosion guard

Removable glass chamber and easily accessible base and top plate allows for an easy cleaning process. Users can rapidly change the chamber, if necessary, to avoid cross contamination of sensitive samples. Tall chamber option is available for carbon evaporation to avoid sample heating, improved uniformity for sputtering and to hold taller samples.

Multiple stage options

The Q150T Plus has specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except for the rotary planetary stage).

Some examples:
- Rotation stage (supplied as standard): 50 mm Ø can accommodate six standard stubs. Height can be pre-set.
- Rotate-tilt stage for improved uniform coating: 50 mm Ø. Tilt and height can be pre-set.
- Variable angle, rotary planetary stage for heavily contoured samples.
- Large flat rotation stage with offset gear box for 4”/100 mm wafers.
- Rotation stage for glass microscope slides.

Other options are available on request.

Safety

The Q150T Plus meets key industry CE standards
- All electronic components are protected by covers
- Implosion guard prevents user injury in event of chamber failure
- Vacuum interlocks remove power from deposition sources to prevent user exposure to high voltage in event of chamber being opened
- Electrical interlocks remove power when source head cover opened
- Overheating protection shuts down power supply
Q150T Plus (continued)

### Options and Accessories

Including details of coating head inserts and specimen stages fitted as standard.

#### Coating head options

- A range of interchangeable, plug-in style coating head inserts are available:
  - 3200 Sputtering head insert suitable for oxidizing and non-oxidizing metals. Supplied with a 54 mm x 0.3 mm thick chromium (Cr) target as standard. For additional targets see Sputtering Targets section. Each.
  - 3210 Additional sputter insert for quick metal change. Note: this is an entire sputtering assembly. Each.
  - 3220 Carbon rod evaporation head insert for 3.05 mm Ø rods. Each.
  - 3240 Carbon rod evaporation head insert for 6.15 mm Ø rods. Note: that EMS recommends 3.05 mm Ø rods as they offer greater process control and are more economical (less wastage). Each.
  - 3250 Carbon fiber evaporation head insert. Each.
  - 3260 Metal evaporation and aperture cleaning head insert, including the ability to evaporate upwards or downwards (T E and T ES versions only). Supplied with a pack of ten tungsten filaments and a molybdenum boat. Each.
  - 3270 Extended height vacuum chamber (214 mm high – the standard chamber is 127 mm high). For increased source to sample distance and for coating large specimens. Each.
  - 3280 Rotating vacuum spigot allows more convenient connection of the vacuum hose to the rear of the Q150T Plus when bench depth is limited. Each.
  - 3290 Film thickness monitor (FTM) attachment. Consists of a built in chamber mounted quartz crystal oscillator (includes crystal). As sputtered or evaporated material is deposited onto the crystal, so its frequency of oscillation is modified. This ‘modification’ is used to measure and control the thickness of material deposited. Each.
  - 3300 Spare quartz crystal for FTM. Each.
  - 3369 Extended glass cylinder assembly, 220 mm H. Each.
  - 3320 Full range vacuum gauge for low and high vacuum measurement (a low vacuum Pirani gauge is fitted as standard). Each.

For our complete selection of specimen stages, please see the Specimen Stage Selection Guide on page 49.
Intuitive software allows the most inexperienced or occasional operator to rapidly enter and store their own process data. For convenience a number of typical sputtering and carbon coating recipes are already stored but also allows the user to create their own. Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.

Automatic, controlled carbon rod evaporation for TEM applications

Careful evaporation allows precise control of carbon thickness (with or without the optional film thickness monitor). The quality of the resulting carbon films is also enhanced by the eradication of “sparking” that is a common feature of less advanced coaters.

For reproducible high-quality carbon films, we would recommend the use of shaped carbon rods. Rods are higher purity, less susceptible to debris and easier to control. Pulsed and ramped carbon rod recipes are supplied as standard.

Recommended applications for Q150 V Plus:

- Ultra-high-resolution magnification SEM
- Carbon coating of TEM grids
- Protective platinum layers for FIB
- R&D of corrosion-, friction-, and wear- protective layers
- Protective layers on medical devices
- BSE imaging
- EDX, WDS, EBSD analysis
- Carbon coating of replicas
- Nano-technology e.g. Zeolites, polymer nanobrushes

These products are for Research Use Only.

Intuitive software allows the most inexperienced or occasional operator to rapidly enter and store their own process data. For convenience a number of typical sputtering and carbon coating recipes are already stored but also allows the user to create their own. Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.

For ultra-fine coatings

**QUICK OVERVIEW**

The Q150V Plus is optimized for high-vacuum applications, with an ultimate vacuum of 1 x 10^-6 mbar. Together with the use of a wide-range Penning/Pirani gauge, this enables the sputtering of oxidizing metals with ultra-fine grain sizes, which are suitable for high resolution imaging. The lower background pressure removes oxygen nitrogen and water vapour from the chamber, avoiding chemical reactions during the sputter process, which could otherwise lead to impurities or defects in the coatings. Similarly, lower scattering allows for high purity, amorphous carbon films of high density.

The Q150V Plus offers all the benefits of the Q150T Plus, but with a finer grain size and thinner coating, for ultra-high-resolution applications (above x 200,000 magnification).

**KEY FEATURES**

- Ultimate vacuum of 1x10^-6mbar
- New multi-color LED visual status indicator
- 16Gb of flash memory can store more than 1000 recipes
- New software sorts recipes per user according to recent use
- Multiple-user profiles can be set up on one machine
- New touch and swipe capacitive screen

**PRODUCT DESCRIPTION**

The Q150V Plus is available in three configurations:

- **Q150V S Plus** — an automatic sputter coater for oxidizing metals with ultra-fine grain size. Available sputtering targets include chromium, iridium and all noble metals
- **Q150V E Plus** — an automatic carbon coater (rod/cord) for TEM applications. For carbon coating TEM grids.
- **Q150V ES Plus** — a combined system capable of both sputtering and carbon coating. The deposition head inserts can be swapped in seconds. Metal evaporation/aperture cleaning option available.

**New user interface has been thoroughly updated:**

- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help screen
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Dual-core ARM processor for a fast, responsive display

Intelligent system logic automatically detects which insert is in place and displays the appropriate operating settings and controls for that process. System prompts user to confirm target material and it then automatically selects appropriate parameters for that material.
Q150V Plus Automatic Coater (continued)

Cool magnetron sputtering

Sputter coating is a technique widely used in various applications; it is possible to create a plasma and sputter metals with high voltage, poor vacuum and no automation. However, this is not suitable for electron microscopy applications because it will heat the sample and can result in damage when the plasma interacts with the sample. The Q150V Plus series uses low temperature enhanced-plasma magnetrons optimized for the turbomolecular pump pressures, combined with low current and deposition control, which ensures your sample is protected and uniformly coated.

The Q150V S Plus and Q150V ES Plus use easy-change, 57 mm diameter, disc-style targets which are designed to sputter oxidizing and noble metals. The Q150V S Plus and Q150V ES Plus are fitted as standard with a chromium (Cr) sputter target. Other targets options include: Au, Au/Pd, Pt/Pd, Pd, Pt, Cu, Ir, W, ITO and Al. Others are available on request.

Pulsed cleaning for Al sputtering

Aluminum (Al) rapidly forms an oxide layer, which can be difficult to remove, but the ES & S Plus have special recipes for aluminum that reduce the oxide removal time and prevent excessive pre-sputtering of the target.

Interchangeable plug-in heads

This allows the user to configure the system as a sputter coater, evaporator or glow discharge system - all in one space saving format. A carbon cord evaporation insert is available as an option. Automatic detection of the head type when changed.

Detachable chamber with built-in implosion guard

Removable glass chamber and easily accessible base and top plate allows for an easy cleaning process.

Users can rapidly change the chamber, if necessary, to avoid cross contamination of sensitive samples.

Tall chamber option is available for carbon evaporation to avoid sample heating, to improve uniformity for sputtering and to hold taller samples.

Multiple stage options

The Q150V Plus has specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except for the rotary planetary stage).

Some examples:
- Rotation stage (supplied as standard): 50 mm Ø can accommodate six standard stubs. Height can be pre-set.
- Rotate-tilt stage for improved uniform coating: 50 mm Ø. Tilt and height can be pre-set.
- Variable angle, rotary planetary stage for heavily contoured samples.
- Large flat rotation stage with offset gear box for 4”/100 mm wafers.
- Rotation stage for glass microscope slides.

Other options are available on request.

Safety

The Q150V Plus meets key industry CE standards
- All electronic components are protected by covers
- Implosion guard prevents user injury in event of chamber failure
- Vacuum interlocks remove power from deposition sources to prevent user exposure to high voltage in event of chamber being opened
- Electrical interlocks remove power when source head cover opened
- Overheating protection shuts down power supply

Sputtering Targets

The Q150V S Plus and Q150V ES Plus are fitted as standard with a 0.3 mm thick chromium (Cr) sputter target. Other optional targets:

Other consumables and spare kits

3600  Metal evaporation basket – pack of 10 (for use with metal evaporation head) each

3610  Two-year spares kit for Q150V S Plus includes: chromium (Cr) target, glass cylinder, carbon fiber cord, quartz crystals, 0-rings each

3620  Two-year spares kit for Q150V E Plus includes: chromium (Cr) target, glass cylinder, carbon fiber cord, carbon fiber – fine, carbon rods 3.05 mm, quartz crystals, 0-rings each

3630  Two-year spares kit for Q150V ES Plus includes: chromium (Cr) target, glass cylinder, carbon fiber cord, carbon fiber – fine, carbon rods 3.05 mm, quartz crystals, 0-rings each

07803  Basic Oil Mist Filter (spare) each

13223  Rotary Pump Oil (spare), 1L each

13225  Rotary Pump Oil (spare), 5L each

27508  0-ring (each) 2 required per coater each

27607  Non-seal L Gasket each

6413  Additional Standard Glass Cylinder Assembly each
Q150 GB Turbo-Pumped Sputter Coater/Carbon Coater — For Glove Box

QUICK OVERVIEW

The Q150 GB is a modular glove box version of the highly successful Q150T ES bench top turbomolecular-pumped coating system - suitable for SEM, TEM and many thin-film applications. The Q150 GB comes as standard with sputtering and carbon rod evaporation inserts and a rotating specimen stage. Options include a metal evaporation insert, glow discharge, a film thickness monitor (FTM), aperture cleaning insert and special stages to suit a range of specimen types.

FEATURES

- Modular construction for mounting in glove boxes
- Integral glove box pressure monitoring
- Remote operation from a touch screen control panel
- Metal sputtering and carbon evaporation in one system
- Fine grain sputtering for advanced high resolution FE-SEM applications
- High vacuum turbo pumping - allows sputtering of a wide range oxidising and non-oxidising metals
- High vacuum carbon rod coating - ideal for SEM and TEM carbon coating applications (carbon fiber available as an option)
- Advanced “anti-stick” carbon rod evaporation gun – simple operation, reproducible results
- Control of evaporation current profile - ensures consistently reproducible carbon films
- Precise thickness control using the film thickness monitor option
- Fully automatic touch screen control – rapid data input, simple operation
- Multiple, customer defined coating schedules can be stored - ideal for multi-user laboratories
- Automatic vacuum control which can be pre-programmed to suit the process and material – no manual needle valve to adjust
- “Intelligent” recognition of system - automatically detects the type of coating insert fitted
- Easy-to-change, drop-in style specimen stages (flat rotation stage as standard)
- Vacuum shut down feature - leaves the process chamber under vacuum when not in use - improved vacuum performance
- Thick film capabilities - up to 60 minutes sputtering time without breaking vacuum
- Power Factor Correction - complies with the current legislation (CE certification) - efficient use of power means reduced running costs
- Three-year warranty

PRODUCT DESCRIPTION

The Q150 GB is single platform for sputtering and carbon rod evaporation. Metal evaporation using filament or boat sources is possible using an optional insert.

Depending upon user preference, the Q150 GB can be a top-of-the-range sputter coater for high resolution scanning electron microscopy (SEM), or a high vacuum carbon coater suitable for SEM and transmission electron microscopy (TEM). The flexibility of the system can be further expanded using a range of optional accessories.

The Q150 GB can rapidly sputter a wide selection of oxidising and non-oxidising metals making it ideal for many thin film applications.

The Q150 GB has an integral turbomolecular pump and additionally requires a suitable rotary pump or dry pump to “back” the turbomolecular pump (see Option and Accessories).

Flexible modular design

A modular design enables the vacuum chamber to be mounted through the base of the glove box or - when modification to the glove box floor is not possible - inside the glove box (optional feedthroughs are required).

A separate power supply housed in a rugged case is designed to be floor mounted and can be positioned conveniently beneath the glove box or bench. The touch screen user interface is housed in a robust stainless steel case and can be positioned outside of the glove box environment, if preferred.

Options for glove box mounting:

Vacuum module mounted in the floor of the glove box

A cut-out is made in the floor of the glove box and the vacuum chamber fitted and sealed with the gasket supplied. External connections from the floor mounted power supply, vacuum pump and argon gas can then be made directly to the chamber.

OR

Vacuum module placed inside the glove box

The chamber assembly is placed inside the glove box and the power supply, vacuum pump and argon gas connections are made through two KF40 feedthroughs in the rear of the glove box.

Note: each Q150 GB is supplied with an accessory/configuration kit to suit either internally or externally mounted vacuum chambers. Additional kits can be designed on a case-by-case basis to allow the system to be adapted to various manufacturers’ glove boxes. Please contact EMS for more details.
Q150 GB Turbo-Pumped Sputter Coater/Carbon Coater — For Glove Box (continued)

**Touch screen user interface**

Enclosed in a stainless steel case and mounted at a convenient position outside the glove box, the touch screen allows multiple users to input and store coating protocols.

**Vacuum module**

The vacuum module houses all the working components, including the efficient 70L/s air-cooled turbomolecular pump. An automatic bleed control ensures optimum vacuum conditions during sputtering and a full range active gauge is fitted as standard to monitor the vacuum.

The Q150 GB includes "vacuum shutdown", a convenient feature which enhances vacuum performance by allowing the chamber vacuum to be maintained when the coater is not in use.

A unique feature of the Q150 GB is the integral pressure interlock switch. This independently monitors the pressure inside the glove box and shuts off the vacuum pump if the glove box atmosphere is unacceptably reduced due to a vacuum leak.

The vacuum chamber is 214mm high to allow for increased source to substrate distances required for coating large specimens. It has an external diameter of 165mm and comes with an integral implosion guard. The chamber assembly is easily removed to allow specimen exchange and chamber cleaning.

A variable speed rotary specimen stage is fitted as standard, with full height adjustment from 0 to 190mm above the base plate; other stages are available as options.

Sputter coating and carbon coating as standard, plus an option for metal evaporation

**"Intelligent" Quick-change deposition inserts**

The deposition inserts can be swapped in seconds and the intelligent system logic automatically recognises which insert is in place and displays the appropriate operating settings.

**High resolution sputter coating**

The Q150 GB features a high-resolution sputter coater insert (3200) for oxidising and non-oxidising (noble) metals. A wide selection of sputtering targets is available, including iridium and chromium, which are highly recommended for FE-SEM applications. Please see Options and Accessories for details of available metal targets.

**Carbon rod evaporation**

The high vacuum carbon rod coating insert (3230) is ideal for the production of highly stable carbon films and surface replicas for transmission electron microscopy (TEM). The system uses economical 3.05mm diameter carbon rods and the advanced “anti-stick” carbon rod evaporation gun offers simple operation and reproducible results. A carbon fiber evaporation insert (3250) is available as an option (see Options and Accessories).

**Metal evaporation/ aperture cleaning option**

A quick change insert (3260) allows metal evaporation from tungsten baskets or molybdenum boats - ideal for thin film applications. For ease of set up in a glove box, the metal charge can be loaded into the evaporation source away from the vacuum chamber.

Each of the above configurations can be used with a range of optional accessories. See options and Accessories for details.

**Rapid data entry**

At the operational heart of Q150 GB is a simple color touch screen, which allows even the most inexperienced or occasional operators to rapidly enter and store their own process data. To further aid ease of use a number of typical sputtering and evaporation profiles are provided.

**Additional Information**

**Options and Accessories** (including details the standard specimen stage)

Coating inserts included with the Q150 GB

A range of interchangeable, plug-in style coating head inserts are available:

- Sputtering head insert (3200) is suitable for oxidising and non-oxidising metals. Supplied with a 54mm Ø x 0.3mm thick chromium target (3417) as standard. For additional targets see "Ordering Information" section.

Note: changing sputtering targets is easy, but additional sputter head inserts can be purchased for even quicker coating material change - see (3210)

- Carbon rod evaporation head insert and accessories for 3.05mm Ø rods (3230)

Optional coating inserts

Carbon rod evaporation head insert for 6.15mm Ø rods (3240).

Note that EMS recommends 3.05mm Ø rods as they offer greater process control and are more economical (less wastage)
**Q150 GB Turbo-Pumped Sputter Coater/Carbon Coater — For Glove Box (continued)**

- Carbon fiber evaporation head insert (3250)
- Metal evaporation and aperture cleaning head insert (3260), using tungsten wire baskets and molybdenum boats. Includes electrode extensions to allow upwards evaporation, if required. Note: when the electrodes are fitted some stage options cannot be used

**Specimen stages**

The Q150 GB has specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except rotary planetary stage).

- 6800-S rotation stage, 50mm Ø (supplied as standard). This stage only rotates – no tilt or height adjustment.
- 6801 rotate-tilt stage, 50mm Ø with height adjustment (target to stage height variable between 37mm and 60mm). The tilt angle can be pre-set.
- 6803 variable angle ‘Rota-Cota’ rotary planetary specimen stage with 50mm Ø specimen platform with six stub positions for 15mm or 6.5mm or 1/8" pin stubs.
- 3360 flat rotation stage for 4"/100mm wafers. Includes gear box which needs to be fitted when the optional FTM is being used or for coating over the full area of the stage.
- 6804 rotation stage for glass microscope slides. Allows two 75 x 25mm slides to be coated.

Note: all rotation stages have rotation speeds that can be variable between 8 and 20 rpm.

**Interlocks**

The Q150 GB is interlocked to prevent continuous pumping of the glove box in the event of a vacuum leak

**Processes**

- Sputtering 0-150mA to a pre-determined thickness (with optional FTM) or by the built-in timer. The maximum sputtering time is 60 minutes (without "breaking" vacuum and with built-in rest periods)
- Carbon evaporation A robust, ripple free, D.C. power supply featuring pulse evaporation ensures reproducible carbon evaporation from rod or fiber sources. Current pulse: 1-90A
- Metal evaporation and aperture cleaning head insert (option) For thermal evaporation of metals from filaments or molybdenum boat can be fitted. The metal evaporation head is set up for downwards evaporation, but upward evaporation can be achieved by fitting two terminal extensions (supplied). Evaporation times: up to four minutes

**Services and other information**

- Gases Quick-connect inlet for: argon sputtering process gas, 99.999% (“zero grade”)
- Nitrogen Venting Gas (no quick-connect – uses the glove box atmosphere as the source)
- Electrical Supply 90-250V ~ 50/60 Hz 1400 VA including rotary pump power. 110/240V voltage selectable

**Conformity**

CE conformity: Power Factor Correction. Complies with the current legislation (CE Certification) and ensures efficient use of power which means reduced running costs

**Vacuum**

- Turbomolecular Pump Internally mounted, 70L/s air-cooled turbomolecular pump
- Rotary Pump 5m³/hr-1 two-stage rotary pump with oil mist filter (order separately: 91003)
- Vacuum Measurement An active full-range gauge is fitted
- Typical Ultimate Vacuum 5x10⁻⁶ mbar
- Sputter Vacuum Range Between 5x10⁻⁴ and 5x10⁻¹ mbar
Other options, including FTM and glow discharge

- 3270 extended height chamber (87mm higher than the standard stage) For tall specimens.
- 3290 Film Thickness Monitor (FTM). Consists of a controller and quartz crystal oscillator built into the Q150 GB and a vacuum feed through, chamber mounted crystal holder and quartz crystal. As sputtered or evaporated material is deposited onto the crystal, so its frequency of oscillation is modified. This “modification” is used to measure and control the thickness of material deposited.
- 4513 glow discharge insert. Used to modify surface properties (eg hydrophobic to hydrophilic conversion).

ORDERING INFORMATION

Q150GB A modular, high resolution turbomolecular-pumped sputter coater/carbon rod evaporator for glove boxes. Includes: sputtering insert, 54mm Ø x 0.3mm chromium target, carbon rod evaporation insert, carbon rods (3.05mm Ø x 300mm) and carbon rod shaper (manual operation). Fitted with a rotation stage each.

Rotary pump requirements (needs to be ordered separately)

91003 Edwards RV3 50L/s two-stage rotary pump, with vacuum hose, coupling kit and oil mist filter each.
91003-E Edwards RV3 50L/s two-stage rotary pump, with vacuum hose, coupling kit and oil mist filter, 220V each.

6550-A Diaphragm pump. A “dry” alternative to the standard 91003 oil-based rotary pump complete with vacuum hose, coupling kit and oil mist filter each.

Options and accessories

3230 Carbon rod evaporation head insert (for 3.05mm Ø rods) each.
3240 Carbon rod evaporation head insert (for 6.15mm Ø rods). each.

Note that EMS recommends 3.05mm Ø rods as they offer greater process control and are more economical.

3260 Carbon fiber evaporation head insert each.
3260 Metal evaporation and aperture cleaning head insert, each including the ability to evaporate upwards or downwards. Supplied with a pack of ten tungsten filaments and a molybdenum boat.

3270 Extended height vacuum chamber (214mm high – the standard chamber is 127mm high). For increased source to sample distance and for coating large specimens each.

3270 Extended height vacuum chamber (214mm high – the standard chamber is 127mm high). The target to stage height is variable between preset limits. A gear box mechanism which positions the stage under the correct target. Also provides rotation drive to the stage. Rotation Speed Max 38 rpm Min 14 rpm each.

3290 Film thickness monitor (FTM) attachment. Each. Consists of a built in chamber mounted quartz crystal oscillator (includes crystal). As sputtered or evaporated material is deposited onto the crystal, so its frequency of oscillation is modified. This “modification” is used to measure and control the thickness of material deposited.

3300 Spare quartz crystal. each.
3320 Full range vacuum gauge for low and high vacuum measurement (a low vacuum Pirani gauge is fitted as standard) each.

4513 Glow discharge insert to modify surface properties (eg hydrophobic to hydrophilic conversion) to clean surface residues each.

3600 Metal evaporation basket - pack of 10 (for use with metal evaporation head) each.
3630 Two-year spares kit for Q150 GB each.

Includes: chromium target, glass cylinder, carbon fiber cord, carbon fiber - fine, carbon rods 3.05mm, quartz crystals, O-rings each.

Specimen stages

6790-S Swinging arm stage drive, a stage drive and positioning mechanism which positions the stage under the correct target. Also provides rotation drive to the stage. Rotation Speed Max 38 rpm Min 14 rpm each.

6800-S Rotating specimen stage for 6” (152 mm) wafers, with rotation variable between preset limits. each.

6801 Rotating 50 mm Ø specimen stage with adjustable tilt. each.
The platform has six specimen stub positions for 15 mm, 10 mm, 6.5 mm or 1/8” pin stubs. The stage rotation speed is variable between preset limits. The target to stage height is variable between 0 mm and 42 mm for the standard stage. When used with the extended height cylinder the target to stage height would be an additional 87 mm.

6802 50 mm Ø variable height specimen stage each with six stub positions for 15 mm, 10 mm, 6.5 mm disc stubs or 1/8” pin stubs. Stage rotation speed variable between preset limits.

Note: Target to stage height is variable between 10 mm and 53 mm for the standard stage. The stage is supplied with two mounting pillars; one provides 10 mm to 32 mm target to stage distance and the other 31 mm to 53 mm. An adjustable stop is used to set the height. When used with the extended height cylinder (optional accessory) the target to stage height would be an additional 87 mm.

6803 50 mm Ø rotary tilting stage. each.
A rotary planetary style stage with a variable tilt angle from horizontal to 30 degrees. The platform has six positions for either 6.5 mm, 10 mm and 15 mm disc stubs or 1/8” pin stubs. Rotation speed is variable between preset limits.

Note: depending upon specimen height, this stage may require the optional extended height cylinder.

6804 A 90 mm Ø specimen stage for glass each.
A microscope slides (up to two 75 mm x 25 mm slides or a single 75 mm x 50 mm slide). The stage can alternatively accommodate up to six 1/8” SEM pin stubs. The stage rotation speed is variable between preset limits. A gear box is included to allow the optional FTM to be used.

For our complete selection of specimen stages, please see the Specimen Stage Selection Guide on page 49 >>>

Glow discharge attachment option During sputtering, optional film thickness monitor (FTM) shown.
Q300T T Plus Triple Target, Large Chamber, Turbo-Pumped Sputter Coater

QUICK OVERVIEW
The Q300T T Plus is a large chamber, turbo-pumped coating system, ideally suited for sputtering a single large diameter specimen up to 8”/200mm or multiple smaller specimens over a similar diameter. Ideal for thin-film applications and SEM/FE-SEM. It is fitted with three sputtering heads to ensure even deposition of individual large specimens or multiple specimens.

Please note it is not possible to sequentially sputter three different sputtering metals from each sputtering head. For sequential coating, see the Q300T D Plus.

KEY FEATURES
- Ultimate vacuum of 1x10⁻⁶mbar or less possible
- New touch and swipe capacitive screen
- USB port for upgrades and download of process log files
- Multiple-use profiles can be set up on one machine
- New software sorts recipes per user according to recent use
- 16GB of memory can store more than 1000 recipes
- New multi-color LED visual status indicator
- Interchangeable stage options
- Three sputter heads for larger area deposition of different materials

PRODUCT DESCRIPTION
Detachable chamber with built-in implosion guard
Removable glass chamber and easily accessible base and top plate allows for an easy cleaning process. Users can rapidly change the chamber, if necessary, to avoid cross contamination of sensitive samples. Tall chamber option is available for improved uniformity for sputtering and to hold larger substrates.

Triple Target Sputtering System
The Q300T T Plus is fitted with three individual sputtering heads to ensure even deposition of individual large specimens or multiple specimens. For economical coating of small specimens, ‘single target’ mode can be selected. They are ideal coaters for the preparation of large specimens for examination by SEM, FEG-SEM. To ensure even deposition, the Q300T T Plus coaters are fitted with a rotating specimen stage and three individual magnetron target assemblies, which enhance the efficiency of the process by using low voltages.

Recommended applications for Q300T T Plus:
- Wafer Inspection
- Multiple sample preparation for SEM

These products are for Research Use Only.

Multiple stage options
The Q300T T Plus has specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and the rotation speed is variable between pre-set limits. Flat rotation stage for 200 mm/8” and 150 mm/6” wafers (fitted as standard).
Q300T T Plus (continued)

Q300T T Plus has a 200 mm wafer capability

**Safety**

The Q300T T Plus meets key industry CE standards

- All electronic components are protected by covers
- Implosion guard prevents user injury in event of chamber failure
- Vacuum interlocks remove power from deposition sources to prevent user exposure to high voltage in event of chamber being opened
- Overheating protection shuts down power supply

**Vacuum control**

High vacuum turbo pumping allows sputtering of a wide range of oxidizing and non-oxidizing metals for thin film and electron microscopy applications. Automatic vacuum control which can be pre-programmed to suit the process and material, therefore removing the need for manual intervention or control.

**Cool magnetron sputtering**

Sputter coating is a technique widely used in various applications; it is possible to create a plasma and sputter metals with high voltage, poor vacuum and no automation. However, this is not suitable for electron microscopy applications because it can heat the sample and result in damage when the plasma interacts with the sample. The Q300T T Plus uses low temperature enhanced-plasma magnetrons optimized for the turbomolecular pump pressures, combined with low current and deposition control, which ensures your sample is protected and uniformly coated.

The Q300T T Plus uses easy-change, 57 mm diameter, disc-style targets which are designed to sputter oxidizing and noble metals. The Q300T T Plus is fitted as standard with a chromium (Cr) sputter target. Other targets options include; Au, Au/Pd, Pt/Pd, Pd, Pt, Cu, Ir, W, ITO and Al, etc.

**Pulsed cleaning for aluminum sputtering**

Aluminum (Al) rapidly forms an oxide layer which can be difficult to remove. The Q300T T Plus has a special recipe for Aluminum that reduces the oxide removal time and prevents excessive pre-sputtering of the target.

**Film thickness monitor**

The Q300T T Plus can be fitted with an optional film thickness monitor (FTM), which measures the coating thickness on a quartz crystal monitor within the chamber, in order to control the coating thickness of material deposited on to the sample.

**New user interface has been thoroughly updated:**

- Dual-core ARM processor for a fast, responsive display
- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Quick and easy creation of process sequences with a simple copy, drag and drop operation

Allows multiple users to input and store coating recipes.

New feature to sort recipes per user according to recent use.

System prompts user to confirm target material and it then automatically selects appropriate parameters for that material.

Intuitive software allows the most inexperienced or occasional operator to rapidly enter and store their own process data. For convenience a number of typical sputtering and carbon coating profiles are already stored but also allows the user to create their own.

Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.
SPECIFICATIONS

**Instrument Case**
590mm W x 535mm D x 420mm H
(maximum height during the opening of the coating head: 772mm)

**Weight**
36 kg (packed: 59kg)

**Packed Dimensions**
730 mm W x 630 mm D x 690 mm H

**Work Chamber**
Borosilicate glass with integral PET implosion guard Size 300 mm outside diameter x 127 mm High

**Display**
115.5mm W x 86.4mm H (active area), 640 RGB x 480 (display format), capacitive touch color display

**User Interface**
Full graphical interface with touch screen buttons, includes features such as a log of the last 1000 coatings and reminders for when maintenance is due

**Specimen Stage**
A flat rotation stage for 6" (150mm) and 8" (200mm) wafers is fitted as standard. A rotating/tilt stage and the "rota cota" rotary tilt stage are also options

**Vacuum**

- **Rotary Pump**
  4 m³/hr, two stage rotary pump with oil mist filter for the 300T T Plus

- **Turbo Pump**
  Internally mounted 70L/sec air cooled

- **Vacuum Measurement**
  Pirani gauge as standard, full range gauge available as an option

**Ultimate Vacuum**
5 x 10⁻⁵ mbar*

**Sputter Vacuum Range**
5x10⁻² to 5x10⁻³ mbar*

*Typical ultimate vacuum of the pumping system in a clean instrument after pre-pumping and venting with dry nitrogen gas

**Processes**

- **Sputter Deposition Current**
  Single target: 1 - 140mA
  All targets: 60 - 420mA

- **Visual Status Indicator**
  A large status multi-color indicator light provides a visual indication of the state of the equipment, allowing users to easily identify the status of a process at distance.

  The indicator LED shows the following states:
  - Initialization
  - Process running
  - Idle
  - Coating in progress
  - Process completed
  - Process ended in fault condition

  Audio indication also sounds on completion of the process.

**Services**

- **Gases**
  process gas argon, 99.999% Nominal 5 psi
Q300T T Plus (continued)

ORDERING INFORMATION

Q300T T Plus
Triple Target, Large Chamber, Turbo-Pumped Sputter Coater, fitted with three sputtering heads to ensure even metal deposition. Includes three 57 mm Ø x 0.3 mm chromium (Cr) sputter targets. A flat rotation stage for 200 mm/8” and 150 mm/6” wafers is fitted as standard.

Rotary pump requirements (needs to be ordered separately)
91003 Edwards RV3 50L/s two-stage rotary pump, with vacuum hose, coupling kit and oil mist filter
each

Specimen stages
6551 Rotating 50 mm Ø specimen stage with adjustable tilt. The platform has six specimen stub positions for 15 mm, 10 mm, 6.5 mm or 1/8” pin stubs. Stage rotation speed is variable between preset limits. No rotation when in single target mode. Target to stage height is variable between zero and 42 mm for the standard stage. When used with the extended height cylinder (optional accessory) the target to stage height would be an additional 87 mm

6552 50 mm Ø variable height specimen stage with six stub positions for 15 mm, 10 mm, 6.5 mm disc stubs or 1/8” pin stubs. Stage rotation speed variable between preset limits
each

6553 50 mm Ø rotary lifting stage. A rotary planetary style stage with variable tilt angle from horizontal to 30 degrees. The platform has six positions for either, 6.5 mm, 10 mm, 15 mm disc stubs, or 1/8” pin stubs. Rotation speed is variable between preset limits. Note: depending upon specimen height, this stage may require the optional extended height cylinder
each

6554 A 90 mm Ø specimen stage for glass microscope slides (up to two 75 mm x 25 mm slides or a single 75 mm x 50 mm slide). The stage can alternatively accommodate up to six 15 mm Ø SEM pin stubs. Stage rotation speed is variable between preset limits. Includes gear box to allow optional FTM to be used.
each

6547 6” Wafer Specimen Stage: A flat adjustable stage capable of accepting 6” or 101.6 mm wafers

6549 A 4” x 102 mm flat drop-in-wafer stage which accepts 2”, 3”, and 4” wafers

For our complete selection of specimen stages, please see the Specimen Stage Selection Guide on page 49

Options and Accessories
6555 Film thickness monitor (FTM) attachment. Including oscillator, feed-through, quartz crystal holder and one quartz crystal
each

6556 Spare quartz crystal
each

6557 Extended height vacuum chamber (214 mm in height – the standard chamber is 127 mm high). For increased source to specimen distance and for coating large specimens
each

6558 A lockable emergency stop (e-stop) switch which can be mounted on top of the system in a position easily accessible for the operator. It is provided with a key to release the knob after activation. Note: the addition of the e-stop does not inhibit or replace the normal On/Off switch function. The e-stop can be retrofitted to existing systems
each

6559 Coating shields. Shields can be fitted to protect large surfaces from coating deposition – easily removable for ease of cleaning
each

6560-A Vacuum spigot allows more convenient connection of the vacuum hose to the rear of the Q300T T Plus when bench depth is limited
each

6561 Full range, active vacuum gauge capable of measurement over the range of 1000 mbar to 5 x 10^-9 mbar. Typical ultimate vacuum of system is 5 x 10^-5 mbar. Note: gauge must be factory fitted
each

6562 Spares kit, including: spare standard glass cylinder, three 3417 chromium (Cr) sputtering targets, vacuum tubing with coupling insert, argon gas tubing, three sputter head magnets, rotary pump oil mist filter and fuses
each

Sputter targets
Note: The Q300T T Plus is fitted as standard with three 0.3 mm chromium (Cr) targets (3417). Other optional targets are available (three required):

3410 57mm Ø x 0.1mm Gold each

3411 57mm Ø x 0.1mm Gold/Palladium (80/20) each

3412 57mm Ø x 0.1mm Platinum each

3413 57mm Ø x 0.1mm Nickel each

3414 57mm Ø x 0.1mm Silver each

3415 57mm Ø x 0.1mm Palladium each

3416 57mm Ø x 0.1mm Copper each

3417 57mm Ø x 0.3mm Chromium each

3418 57mm Ø x 0.5mm Tungsten each

3419 57mm Ø x 1.5mm Chromium each

3420 57mm Ø x 0.2mm Tungsten each

3421 54mm Ø x 1.5mm Carbon each

3422 57mm Ø x 0.1mm Aluminium each

3423 57mm Ø x 0.1mm Platinum/Palladium (80/20) each

3424 57mm Ø x 1.5mm Titanium each

3425 57mm Ø x 0.3mm Platinum/Palladium (80/20) each

3426 57mm Ø x 0.3mm Gold each

3427 57mm Ø x 0.3mm Gold/Palladium (80/20) each

3428 57mm Ø x 0.3mm Platinum each

3429 57mm Ø x 0.5mm Titanium each

3430 57mm Ø x 0.1mm Iron each

3431 57mm Ø x 0.3mm Iridium each

3432 57mm Ø x 0.1mm Cobalt each

3433 57mm Ø x 0.1mm Tin each

3434 57mm Ø x 0.1mm Molybdenum each

3435 57mm Ø x 0.3mm Magnesium each

3435-5 57mm Ø x 0.3mm Magnesium each

3436 57mm Ø x 0.1mm Tantalum each

3437 57mm Ø x 3mm Indium Tin Oxide (90/10) each

Coating shields. Shields can be fitted to protect large surfaces from coating deposition – easily removable for ease of cleaning

Sputter targets
Note: The Q300T T Plus is fitted as standard with three 0.3 mm chromium (Cr) targets (3417). Other optional targets are available (three required):

3410 57mm Ø x 0.1mm Gold each

3411 57mm Ø x 0.1mm Gold/Palladium (80/20) each

3412 57mm Ø x 0.1mm Platinum each

3413 57mm Ø x 0.1mm Nickel each

3414 57mm Ø x 0.1mm Silver each

3415 57mm Ø x 0.1mm Palladium each

3416 57mm Ø x 0.1mm Copper each

3417 57mm Ø x 0.3mm Chromium each

3418 57mm Ø x 0.5mm Tungsten each

3419 57mm Ø x 1.5mm Chromium each

3420 57mm Ø x 0.2mm Tungsten each

3421 54mm Ø x 1.5mm Carbon each

3422 57mm Ø x 0.1mm Aluminium each

3423 57mm Ø x 0.1mm Platinum/Palladium (80/20) each

3424 57mm Ø x 1.5mm Titanium each

3425 57mm Ø x 0.3mm Platinum/Palladium (80/20) each

3426 57mm Ø x 0.3mm Gold each

3427 57mm Ø x 0.3mm Gold/Palladium (80/20) each

3428 57mm Ø x 0.3mm Platinum each

3429 57mm Ø x 0.5mm Titanium each

3430 57mm Ø x 0.1mm Iron each

3431 57mm Ø x 0.3mm Iridium each

3432 57mm Ø x 0.1mm Cobalt each

3433 57mm Ø x 0.1mm Tin each

3434 57mm Ø x 0.1mm Molybdenum each

3435 57mm Ø x 0.3mm Magnesium each

3435-5 57mm Ø x 0.3mm Magnesium each

3436 57mm Ø x 0.1mm Tantalum each

3437 57mm Ø x 3mm Indium Tin Oxide (90/10) each
What is... Carbon Evaporation?

The use of Carbon Evaporation is well known in Electron Microscopy for support films and replicas in TEM, and X-Ray Microanalysis and conducting coatings in SEM. The films are continuous for thicknesses of 2nm (or 20 Angstroms) or more, and free of significant structure. The most common form of deposition is from resistance heated carbon, or graphite rods, spectrographically pure. The rods are shaped to achieve a high current density at the point of contact of the rods with sufficient temperature being generated to cause the evaporation. At this point, the appearance being that of small, bright, glowing particles of carbon. To achieve the required vacuum condition of $1 \times 10^{-4}$ mbar, or better, requires the use of Diffusion or QUICK

**OVERVIEW**

The Q300T ES is a large chamber, turbomolecular-pumped coating system ideally suited to metal evaporation onto large diameter specimens up to 6'/152 mm (for example a wafer) or smaller multiple specimens. The Q300T ES also comes with interchangeable sputtering and carbon evaporation inserts to allow a coating radius of up to 4'/102 mm.

**KEY FEATURES**

- Metal evaporation, carbon evaporation and metal sputtering — in one space saving design
- Larger area metal evaporation — up to 6'/152 mm
- Larger area sputter/carbon coating — up to 4'/102 mm diameter
- High vacuum sputtering — oxidizing and non-oxidizing (noble) metals: suitable for SEM, high resolution FE-SEM and many thin film applications
- High vacuum carbon coater — ideal for SEM and TEM carbon coating
- Controlled, ramped carbon rod evaporation — precise control of carbon thickness. Non-sparking process gives superior quality films
- Up to 60 minutes sputtering time — thick films capabilities
- Three-Year Warranty

**PRODUCT DESCRIPTION**

The Q300T ES is a large chamber, turbomolecular-pumped coating system ideally suited to metal evaporation onto large diameter specimens up to 6'/152 mm (for example a wafer) or smaller multiple specimens. The Q300T ES also comes with interchangeable sputtering and carbon evaporation inserts to allow a coating radius of up to 4'/102 mm.

The sputter coating insert will deposit both oxidizing metals, e.g. chromium and Aluminum and non-oxidizing (noble) metals such as gold and platinum. A chromium (Cr) target is fitted as standard.

The Q300T ES has a full range of optional accessories, including specimen stages and film thickness measurement which means the system can be tailored to the precise requirements of the user.

**Thermal evaporation of metals**

The Q300T ES allows controlled thermal evaporation of metals onto large substrates (up to 6'/152 mm). For many evaporative processes, tungsten filaments supplied with the system are used. However, some metals require the use of a molybdenum boat, which can also be used for heat-cleaning SEM and TEM apertures.

The evaporation head is normally positioned for downwards evaporation, but for small specimens upward evaporation is possible using two terminal extensions supplied with the system.
Sputter coating for high resolution FE-SEM and thin film applications

The advance design of sputtering head, power supply and system control allows sputtering of both oxidizing and non-oxidizing (noble) metals for thin film applications and for scanning electron microscopy (SEM) coating. The full range of target materials available is extensive and detailed in the Ordering Information section.

For sputtering applications where thick films are required, then the Q300T ES can operate for up to 60 minutes.

High vacuum carbon evaporation for SEM and TEM

The carbon rod evaporation insert allows high quality carbon films to be deposited over a radius of up to 4”/102 mm.

The Q300T ES uses controlled ramped carbon rod evaporation to ensure optimum control of the process and quality of results (with or without the optional film thickness measurement system). In addition the quality of the resulting carbon films is enhanced by the eradication of “sparking” which is a common problem with less advanced coating systems.

High vacuum turbomolecular pumping and vacuum measurement

The Q300T ES is fitted with an internally mounted 70 L/s turbomolecular pump backed by a 5m3/hr two-stage rotary pump (order separately). A full range vacuum measurement gauge is included. Typically ultimate vacuums of around 5 x 10^-5 mbar can be expected in a clean system after pre-pumping with dry nitrogen gas. For details of pumping options, see Ordering Information.

Touch-screen control and stored recipes

At the operational heart of the Q300T ES is a color touch screen which allows users to rapidly enter and store their own process data. A range of typical sputtering and evaporation profiles are pre-installed. The Q300T ES uses an ‘Intelligent’ recognition system that automatically detects the type of coating insert fitted and “becomes” either an evaporator, carbon coater or sputter coater.

Vacuum chamber and specimen stages

The Q300T ES is presented in a custom-molded, one-piece case allowing easy servicing access. The case houses all the working components and includes an automatic bleed control that ensures optimum vacuum conditions during sputtering.

The vacuum chamber has an internal diameter of 283 mm/11” and comes with an integral safety guard. The vacuum shutdown option enhances vacuum performance by allowing the chamber vacuum to be maintained when the coater is not in use.

A variable speed rotary specimen stage is fitted as standard and accommodates specimens up to 4”/100 mm in diameter. For details of other stages, see Ordering Information.

Pumping Requirement

A suitable rotary vacuum pump is required. The Pfeiffer DUO 6 5m3/hr two-stage rotary vacuum pump (91003) is ideal for this purpose. Dry pumping alternatives are also available. See Ordering Information for more details.
Terms and Techniques

**Magnetron Sputtering**

Magnetron sputtering using a crossed-field electromagnetic configuration keeps the ejected secondary electrons near the cathode (target) surface and in a closed path on the surface. This allows a dense plasma to be established near the sputter target surface. The ions that are accelerated from the plasma do not sustain energy loss by collision before they bombard the sputter target.

For electron microscopy (EM) specimen coating, the magnetron sputtering head design ensures that minimal heat energy (electrons) reach the specimen surface. This is important as it reduces heat damage to specimen and is a significant factor in ensuring the grain size within the sputtered film is optimally small for high resolution field emission scanning electron microscopy (FE-SEM).

**Film Thickness Monitor (FTM)**

A film thickness monitor can be used to monitor and control the thickness of sputtered and evaporated metal films. A gold-coated quartz crystal is mounted in the vacuum chamber of the coating system, ideally close to the specimen or substrate. The quartz crystal is made to oscillate at a defined frequency, using an externally-mounted oscillator. As metal is deposited on the quartz crystal, the frequency of oscillation alters and the change is converted to a digital (eg LED) display on the monitoring unit.

Film thickness monitors are available for use with most of our coating systems and cryo preparation systems.

**Turbomolecular Pump**

A turbomolecular (turbo) pump is a type of vacuum pump used to obtain and maintain high vacuum. The principle of operation is that gas molecules within a vacuum chamber can be given momentum in a desired direction by repeated collisions with a rapidly spinning turbine rotor. The rotor hits gas molecules from the inlet of the pump towards the exhaust in order to create or maintain a vacuum. A turbo pump normally works in tandem with a low-vacuum pump, such as a rotary vacuum pump, which is used to rough pump the vacuum system (eg sputter coater or vacuum evaporator) during initial pump-down period, and to back the turbo pump (ie remove gases from the back of the pump) during high-vacuum operation.

**Iridium Sputter Coating**

Sputtering with iridium (Ir) is increasingly popular for high resolution sputter coating of field emission scanning electron microscopy (FE-SEM) specimens, because iridium will produce films with very small grain structure and it is a non-oxidising metal. It is increasingly preferred to chromium (Cr) as a coating material for FE-SEM. Iridium-coated specimens can be stored at atmospheric pressure, compared to chromium - which readily oxidises on contact with air.

**III Q300T ES (continued)**

**Options and Accessories**

**Specimen stages and holders**

The Q300T ES has additional specimen stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except for the rotary planetary stage). Rotation speeds are variable between preset limits.

- Rotation stage for 4” wafers (supplied with system)
- Rotation stage for 6” wafers
- Flat rotation stage for SEM specimen stubs
- Rotation stage with preset tilt for SEM specimen stubs
- Rotate-tilt (rotary-planetary style) stage
- Rotation stage for glass microscope slides
- Eight-place stage for 25 mm or 30 mm embedded polished specimens
- “Sun and planets” style rotary stage; Three platforms, each 92 mm Ø
- Microscope coverslip stage for nine 20 mm x 20 mm coverslips
- TEM grid holder

**Other options**

- Extended height chamber (supplied with the Q300T ES)
- Standard height chamber
- Film thickness monitor (FTM)
- Conductance film monitor (CFM)

ORDERING INFORMATION

**Q300T ES**
Turbo molecular-pumped sputtering, metal evaporation and carbon coating system with 300 mm Ø x 215 H mm work chamber. Consists of high quick release sputter insert with a 3417 57 mm Ø x 0.3 mm chromium (Cr) target. High vacuum carbon rod evaporation coater and metal evaporation head. Coating inserts are interchangeable. A 4" wafer stage supplied as standard. Integrated full range gauge assembly for high vacuum measurement.

Q300T D Plus Dual Target Sequential Sputtering System

QUICK OVERVIEW
Suitable for multi-layer sequential sputtering of two materials, the Q300T D Plus has two independent sputtering heads, which allows sequential sputtering of two metals without the need to break vacuum. The system is fully automated with user defined recipes controlling the pumping sequence, time, number of sputter cycles, and the current used during the process. Unlimited layers of varying thickness from two target materials can be sputtered sequentially by cycling between both targets. When not in use the targets are shuttered for protection from contamination.

KEY FEATURES
- Capable of achieving vacuum of 5 x 10⁻⁵ mbar
- New touch and swipe capacitive screen
- USB port for upgrades and download of process log files
- Multiple-user profiles can be set up on one machine
- New software sorts recipes per user according to recent use
- 16GB of memory can store more than 1000 recipes
- New multi-color LED visual status indicator
- Interchangeable stage options
- Three sputter heads for large area deposition of different materials
- Single head selection for small samples

PRODUCT DESCRIPTION
Improved Interface
- Dual-core ARM processor for a fast, responsive display
- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Quick and easy creation of process sequences with a simple copy, drag and drop operation

Recommended applications for Q300T D Plus:
- Ideal for multi-layer coating
- Adhesion studies

These products are for Research Use Only.

Detachable chamber with built-in implosion guard
Removable glass chamber and easily accessible base and top plate allows for an easy cleaning process. Users can rapidly change the chamber, if necessary, to avoid cross contamination of sensitive samples. Tall chamber option is available for improved uniformity for sputtering and to hold larger substrates.

Dual head sputtering – for sequential sputtering
The Q300T D Plus has two independent sputtering heads to allow sequential sputtering of two different metals without the need to ‘break’ vacuum, for example, a thin ‘seeding’ layer of chromium (Cr) followed by deposition of gold (Au). An automatic shutter mechanism enables cleaning of oxidizing sputter targets and protects the second target and substrate during coatings. For single metal applications one target can be selected.

Multiple stage options
The Q300T D Plus has substrate stages to meet most requirements. All are easy-change, drop-in style (no screws) and are height adjustable (except the rotary planetary stage). A swinging arm stage drive is supplied as standard, which is a stage drive and positioning mechanism that positions the stage under the correct target. Rotation speed is variable between 14-38 rpm.

In addition a flat, adjustable stage capable of accepting 4" (101.6 mm) wafers is supplied as standard with the Q300T D Plus.

As an accessory, a 6" wafer stage is available, which is a flat adjustable stage capable of accepting 6" or 150 mm wafers. The stage includes two masks for improving uniformity of coating.

continued >>>>
Q300T D Plus (continued)

Rotation stage – 50 mm Ø. This stage only rotates and has no tilt or height adjustment.
Rotate-tilt stage – 50 mm Ø. With height adjustment (target to stage height variable between 30-80 mm). The tilt angle can be pre-set (horizontal to 30°).
Rotation stage for glass slides – 25 mm x 76 mm

Safety
The Q300T D Plus meets key industry CE standards
• All electronic components are protected by covers
• Implosion guard prevents user injury in event of chamber failure
• Vacuum interlocks remove power from deposition sources to prevent user exposure to high voltage in event of chamber being opened
• Overheating protection shuts down power supply

Vacuum control
High vacuum turbo pumping allows sputtering of a wide range of oxidizing and non-oxidizing metals for thin film and electron microscopy applications. Automatic vacuum control which can be pre-programmed to suit the process and material, therefore removing the need for manual intervention or control.

Cool magnetron sputtering
Sputter coating is a technique widely used in various applications; it is possible to create a plasma and sputter metals with high voltage, poor vacuum and no automation. However, this is not suitable for some applications because it can heat the substrate and result in damage when the plasma interacts with the substrate. The Q300T D Plus uses low temperature enhanced-plasma magnetrons optimized for the turbomolecular pump pressures, combined with low current and deposition control, which ensures your substrate is protected and uniformly coated.

The Q300T D Plus uses easy-change, 57 mm diameter, disc-style targets which are designed to sputter oxidizing and noble metals. It is fitted with gold (Au) and chromium (Cr) sputter targets as standard.

New user interface has been thoroughly updated:

- Dual-core ARM processor for a fast, responsive display
- Capacitive touch screen is more sensitive for ease of use
- User interface software has been extensively revised, using a modern smartphone-style interface
- Comprehensive context-sensitive help
- USB interface allows easy software updates and backing up/copying of recipe files to USB stick
- Process log files can be exported via USB port in .csv format for analysis in Excel or similar. Log files include date, time and process parameters.
- 16GB of flash memory can store more than 1000 recipes
- Quick and easy creation of process sequences with a simple copy, drag and drop operation

Allows multiple users to input and store coating recipes.

New feature to sort recipes per user according to recent use.

System prompts user to confirm target material and it then automatically selects appropriate parameters for that material.

Intuitive software allows the most inexperienced or occasional operator to rapidly enter and store their own process data. For convenience a number of typical sputtering and carbon coating profiles are already stored but also allows the user to create their own.

Software detects failure to achieve vacuum in a set period of time and shuts down the process in case of vacuum leak, which ensures pump protection from overheating.
**SPECIFICATIONS**

**Instrument Case**
590mm W x 535mm D x 420mm H
(maximum height during the opening of the coating head: 772mm)

**Weight**
36 kg (packed: 59kg)

**Packed Dimensions**
730 mm W x 630 mm D x 690 mm H

**Work Chamber**
Borosilicate glass with integral PET implosion guard
Size 300 mm outside diameter x 127 mm High

**Display**
115.5mm W x 86.4mm H (active area),
640 RGB x 480 (display format),
capacitive touch color display

**User Interface**
Full graphical interface with touch screen buttons, includes features such as a log of the last 1000 coatings and reminders for when maintenance is due

**Specimen Stage**
A flat adjustable stage capable of accepting either 4” or 6” wafers is mounted on a swinging arm stage, which rotates the stage under the targets to optimise coating. Rotation speed is variable from 14rpm to 38rpm

**Vacuum**

**Rotary Pump**
50L/min two stage rotary pump with oil mist filter

**Turbo Pump**
Internally mounted 70L/sec air cooled

**Vacuum Measurement**
Pirani gauge as standard, full range gauge available as an option

**Ultimate Vacuum**
5 x 10⁻⁵mbar*

**Sputter Vacuum Range**
5x10⁻³ to 5x10⁻² mbar*

*Typical ultimate vacuum of the pumping system in a clean instrument after pre-pumping and venting with dry nitrogen gas

**Processes**

**Sputter Deposition Current**
150 mA

**Visual Status Indicator**
A large status multi-color indicator light provides a visual indication of the state of the equipment, allowing users to easily identify the status of a process at distance.

The indicator LED shows the following states:
- Initialization
- Process running
- Idle
- Coating in progress
- Process completed
- Process ended in fault condition

Audio indication also sounds on completion of the process.

**Services**

**Gases**
process gas argon,
99.999% Nominal 5psi

**Vent Gas**
Nitrogen (optional), Nominal 5psi

---

**Pulsed cleaning for Aluminum sputtering**

Aluminum (Al) rapidly forms an oxide layer which can be difficult to remove. The Q300T D Plus has a special recipe for Aluminum that reduces the oxide removal time and prevents excessive pre-sputtering of the target.

**Film thickness monitor**

The Q300T D Plus can be fitted with an optional dual film thickness monitor (FTM), which measures the coating thickness on two quartz crystal monitors located within the chamber. The thickness measured on the monitor can be correlated to the thickness on the substrate using a mathematical formula built into the software; this allows the user to control the thickness of material deposited on to the substrate. For example, the Q300T D Plus can automatically terminate a coating profile when the required thickness has been achieved. Alternatively, the process can be terminated by time.

<tbody>
<tr>
<td>0300T D Plus</td>
<td>Dual Target Sequential Sputtering System; includes a 57 mm Ø x 0.3 mm chromium (Cr) target and a 57 mm Ø x 0.1 mm thick gold (Au) target. A flat rotation stage for 4/100 mm wafers is included.</td>
<td>each</td>
</tr>
<tr>
<td>Rotary pump requirements (needs to be ordered separately)</td>
<td>91003 Edwards RV3 50L/s two-stage rotary pump, with vacuum hose, coupling kit and oil mist filter</td>
<td>each</td>
</tr>
<tr>
<td>6548</td>
<td>XDS 5 Scroll Pump</td>
<td>each</td>
</tr>
<tr>
<td>6550-A</td>
<td>Diaphragm pump. A “dry” alternative to the standard 91003 oil-based rotary pump complete with vacuum hose, coupling kit and oil mist filter</td>
<td>each</td>
</tr>
<tr>
<td>Specimen stages</td>
<td>6791-S</td>
<td>Swinging arm stage drive, a stage drive and positioning mechanism which positions the stage under the correct target. Also provides rotation drive to the stage. Rotation Speed Max 38 rpm Min 14 rpm</td>
</tr>
<tr>
<td>6800-S</td>
<td>Rotating specimen stage for 6” (152 mm) wafers, with rotation variable between preset limits.</td>
<td>each</td>
</tr>
<tr>
<td>6801</td>
<td>Rotating 50 mm Ø specimen stage with adjustable tilt. The platform has six specimen stub positions for 15 mm, 10 mm, 6.5 mm or 1/8” pin stubs. Stage rotation speed is variable between preset limits. The target to stage height is variable between 0 mm and 42 mm for the standard stage. When used with the extended height cylinder the target to stage height would be an additional 87 mm.</td>
<td>each</td>
</tr>
<tr>
<td>6802</td>
<td>50 mm Ø variable height specimen stage with six stub positions for 15 mm, 10 mm, 6.5 mm disc stubs or 1/8” pin stubs. Stage rotation speed variable between preset limits. Note: Target to stage height is variable between 10 mm and 53 mm for the standard stage. The stage is supplied with two mounting pillars; one provides 10 mm to 32 mm target to stage distance and the other 31 mm to 53 mm. An adjustable stop is used to set the height. When used with the extended height cylinder (optional accessory) the target to stage height would be an additional 87 mm.</td>
<td>each</td>
</tr>
<tr>
<td>6803</td>
<td>50 mm Ø rotary lifting stage. A rotary planetary style with a variable tilt angle from horizontal to 30 degrees. The platform has six positions for either 6.5 mm, 10 mm and 15 mm disc stubs or 1/8” pin stubs. Rotation speed is variable between preset limits. Note: depending upon specimen height, this stage may require the optional extended height cylinder.</td>
<td>each</td>
</tr>
<tr>
<td>6804</td>
<td>A 90 mm Ø specimen stage for glass microscope slides (up to two 75 mm x 25 mm slides or a single 75 mm x 50 mm slide). The stage can alternatively accommodate up to six 1/8” SEM pin stubs. The stage rotation speed is variable between preset limits. A gear box is included to allow the optional FTM to be used.</td>
<td>each</td>
</tr>

EMS 500, 550, 575, 650 and 675 Sputter Coaters and EMS 975 and 975S Large Chamber Turbo Evaporator

EMS is pleased to offer the 150 and 300 series sputter coater and combined carbon and sputter coater.

- **Q150R ES Plus** – a combined system with sputtering and carbon fibre coating replaces the EMS 500 and 550.
- **Q150T S Plus** replaces the EMS 575X
- **Q300T D Plus** replaces the EMS 575XD
- **Q300R T Plus** and **Q300T T Plus** replace the EMS 600, EMS 650, and the EMS 675X

What is... Critical Point Drying?

Critical Point Drying is so named as it includes, as part of its process, the occurrence known as the continuity of state for which there is no apparent difference between the liquid and gas state of a medium, the surface tension between this interface reducing to zero. This occurs at a specific temperature and pressure with resulting density, and is known as the Critical Point. This condition of zero surface tension can be used to dry Biological Specimens, avoiding the damaging effects of surface tension.

In biological specimens we are mainly concerned with the removal of water. Unfortunately, the critical point for water of +374°C and 3212 p.s.i. is inconvenient, and would cause heat damage to the specimen. The most common and convenient transitional medium for critical point drying is Carbon Dioxide (CO₂), which has a critical point at 31°C and 1072 p.s.i. However, it is not miscible with water, and therefore, we have to involve a third medium, commonly Acetone, which is termed the intermediate fluid. We can now convert our transitional fluid, typically CO₂, from liquid to gas without surface tension at the critical point.

Techniques and Applications

A summary of the critical point drying method

Critical point drying is an established method of dehydrating biological tissue prior to examination in the Scanning Electron Microscope. The technique was first introduced commercially for SEM specimen preparation by Polaron Ltd in 1971. The original design concepts, which included a horizontal chamber, are still embodied in the design of the E3100 CPD model.

In recent years we have introduced two further models: the K850, which features built-in chamber cooling and heating, and the K850WM, which is designed for drying a 100mm/4” silicon wafer.

All three models have found general acceptance in many laboratories throughout the world. Together, these critical point dryers offer the user a choice most suited to the particular specimen preparation requirements.

The phase diagram shows the pressure to temperature ranges where solid, liquid and vapor exist. The boundaries between the phases meet at a point on the graph called the triple point. Along the boundary between the liquid and vapor phases it is possible to choose a particular temperature and corresponding pressure, where liquid and vapor can co-exist and hence have the same density. This is the critical temperature and pressure.

Critical point drying relies on this physical principle. The water in biological tissue is replaced with a suitable inert fluid whose critical temperature for a realizable pressure is just above ambient. The choice of fluids is severely limited and CO₂ is universally used today, despite early work with Freon 13 and nitrous oxide.

With CO₂ a critical point of approximately 35°C can be achieved at a pressure of around 1,200psi. Therefore if the water is replaced with liquid CO₂ and the temperature then raised to above the critical temperature, the liquid CO₂ changes to vapor without change of density and therefore without surface tension effects which distort morphology and ultra structure.

Since liquid CO₂ is not sufficiently miscible with water, it is necessary to use an intermediate fluid which is miscible with both water and liquid CO₂. In practice intermediate fluids commonly used are methanol, ethanol, amyl acetate and acetone. The advent of Scanning Electron Microscopy (SEM) in the study of surface morphology in biological applications made it imperative that the surface detail of a specimen was preserved. Air (evaporative) drying of specimens can cause severe deformation and collapse of structure - the primary cause of such damage being the effects of surface tension. The specimen is subject to considerable forces, which are present at the phase boundary as the liquid evaporates. The most common specimen medium, water, has a high surface tension to air; by comparison that for acetone is considerably lower. The surface tension could be reduced by substitution of a liquid with a lower surface tension with thereby reduced damage during air-drying. However, the occurrence of what is known as ‘continuity of state’ suggests a drying technique for which the surface tension can be reduced to zero. If the temperature of liquefied gas is increased the meniscus becomes flatter indicating a reduction in the surface tension. If the surface tension becomes very small the liquid surface becomes very unsteady and ultimately disappears.

When this ‘critical point’ is reached, it is possible to pass from liquid to gas without any abrupt change in state.
Techniques and Applications

Critical Point Drying Principles

If a specimen had been in the liquid during this process it would have experienced a transition from a ‘wet’ to a ‘dry’ gas environment without being in contact with a surface, in this way avoiding the damaging effects of surface tension.

This is termed Critical Point Drying (CPD), the basis of which are the classic experiments carried out over 100 years ago during investigations on the liquification of gases.

The Critical Phenomena

The principle of the experiments, which were initially carried out using carbon dioxide (CO\(_2\)), was to measure the change in volume with the application of pressure, of a fixed mass of gas, while maintaining a constant temperature. This was repeated for a range of different temperatures.

The results are best understood by considering the graph obtained from plotting pressure (P) against volume (V) for the series. This is shown in Figure 1; the curves obtained are termed ‘isothermals’.

Consider first the 10˚C isothermal at low applied pressure. The CO\(_2\) is gaseous (vapor) and generally exhibits the characteristics of a gas (Boyle’s Law) over the range from ‘r’ to ‘s’. From point ‘s’ a very slight increase in pressure results in a change from vapor state to the liquid state. This is the phenomena of saturation. From ‘s’ to ‘t’ the pressure is virtually constant while the volume is decreasing and at ‘t’ the substance is all liquid.

From point ‘t’ the graph becomes almost vertical indicating significant application of pressures for very little change in volume, liquids being virtually incompressible.

The 20˚C isothermal has similar general characteristics, however there is less difference between points ‘r’ to ‘s’ compared to the difference between equivalent points ‘s’ to ‘t’ on the 10°C isothermal; these points representing the difference in volume occupied between the vapor phase and the liquid phase.

This indicates that the densities of the saturated vapor and liquid are approaching each other, also the slight departure from the vertical ‘v’ shows the compressibility is greater than that at higher pressures. This shows that the properties of the liquid and gas states of the substance are becoming similar and will ultimately coincide. This in fact is realized at the 31.1˚C isothermal, which does not show any horizontal discontinuity. The temperature at which this occurs is termed the Critical Temperature and has an associated Critical Pressure and density and hence for a particular mass of gas, a Critical Volume. If a liquid was heated in a closed system so that the critical pressure could be attained, at the critical temperature, any visible meniscus would disappear; the surface tension would be zero and it would not be possible to distinguish between the properties of a liquid or a gas. We therefore have continuity of state. Above this temperature the gas cannot be liquified by the addition of pressure and strictly speaking a substance should only be classified as a gas above its critical temperature, below this temperature where it could possibly be liquified by the application of pressure, it is more precisely termed a vapor.

The critical phenomena can be utilized as a drying technique as it achieves a phase change from liquid to dry gas without the effects of surface tension and is therefore suitable for delicate biological specimens.

However, it is not surprising that the initial investigations were on CO\(_2\) as will be apparent from Figure 2, showing a table of critical constants for some common substances. Even the practical achievement of the critical conditions would not assist the biologist, as the specimens would suffer significant thermal damage if we attempted to apply the technique direct for the removal of water from specimens.

Techniques and Applications

Critical Point Drying Principles (continued)

Therefore CO\(_2\) remains the most common medium for the CPD procedure and is termed the "Transitional Fluid". However, CO\(_2\) is not miscible with water and therefore water has to be replaced in the specimen with another fluid which is miscible with CO\(_2\), this is termed the "Intermediate Fluid". Ideally it will be able to replace the water in the specimen, and also serve as the 'Dehydration Fluid'. This is not exclusively the case, and additional steps may be used for particular circumstances.

However, where it is being utilized for both processes, texts may refer to it under the different headings, dehydration and intermediate, depending at what stage it is being used in the specimen preparation schedule. Prior to any of these stages chemical fixation of the specimen must be carried out (normally using glutaraldehyde - osmium procedures).

NOTE
The whole discipline of specimen preparation (chemical or vapor fixation) prior to the transitional stage is only mentioned in its most basic terms, procedures vary according to the type and nature of the specimens. Further references should be obtained.

a) Intermediate Stage
As mentioned previously this involves dehydration and intermediate fluids, the following is a possible schedule.

(Wet Specimen) H\(_2\)O \(\rightarrow\) Acetone \(\rightarrow\) CO\(_2\) \(\rightarrow\) C.P.D. (Dry Specimen)

The specimen is usually processed through varying concentrations of dehydration fluid, culminating in complete replacement of the water with this intermediate fluid. Because it has a low surface tension the specimen is less likely to experience damage due to evaporation while transferring to the chamber, also being miscible with CO\(_2\) (the Transitional Fluid) ensures satisfactory conditions after flushing (purging) for the CPD process to commence.

(Wet Specimen) H\(_2\)O \(\rightarrow\) Acetone \(\rightarrow\) 30%* 100% \(\rightarrow\) CO\(_2\)** \(\rightarrow\) C.P.D (Dry Specimen)

Note:
*50/60/70/80/90 typically 10 minutes each
** Flush Typically 3 times

The table (Figure 3) gives an indication of some intermediate fluids. (Water is 73 Dynes/cm.)

Having transferred the specimen to the chamber in the Intermediate Fluid, the chamber is flushed several times to replace it with the Transitional Fluid. The process from which the complete techniques derives its name CPD can now be initiated.

CO\(_2\) grades required for critical point drying

Generally speaking, the grade we recommend is 'normal' grade - that is the one most commonly offered by industrial gas suppliers. In most parts of the world, 'normal' grade of CO\(_2\), from the suppliers, is specified as 'N4.5' or 99.995% minimum purity with a maximum level of 50ppm of impurities.

There are, however, two other grades available by special order from most gas suppliers. One is 'N4.0' or 99.99% (less pure than 'normal' grade). The other is 'N5.5' or 99.9995% minimum purity. The N5.5 purity is easier to find in those parts of the world where there is high level of activity in electronics, since these customers often demand gases with higher purities.

We are not aware of anyone who has ever reported either superior results using N5.5 purity vs N4.5, or inferior results using N4.5 vs N5.5.

However, we do want our customers to have the benefit of such detail about liquid carbon CO\(_2\) procurement in the event they should ever find reason to believe that their particular specimens might benefit from the higher purity product.

Remember, the requirement is for LIQUID carbon dioxide and NOT gaseous carbon dioxide. For this reason a cylinder with an internal ‘siphon’ must be specified. A siphon cylinder is normally denoted by a white stripe painted along its length. No pressure regular is needed.
Techniques and Applications

Critical Point Drying Principles (continued)

(b) Transitional Stage

As discussed previously (see Figure 1) the conditions for which the critical point passage can be obtained for CO₂ are 31.1°C and 1072 psi. However, it must be remembered that these isothermals are obtained from a fixed mass of gas and an applied pressure for a series of constant temperatures.

In the laboratory application of CPD we have a fixed volume which is filled with the transitional fluid. Some typical examples of which are given in figure 4.

Pressure is obtained by the effect of applying heat and while it can be readily appreciated that we can take a liquid from below its critical temperature and obtain the transition to gas above its critical temperature, an understanding of the relevant 'start' and 'end' points and the cycle involved is required in evaluating the design and performance of CPD equipment. It is still useful however, to utilize these CO₂ isothermals as indicated in figure 5 with the Superimposed 'arrows' showing differing conditions for the CPD device.

Starch Grains in Potato Tuber

Critical point dried fractured cell from the tuber of potato (Solanum tuberosum), demonstrating thin cell walls starch grains (amyloplasts).

Glandular Trichomes on Modified Leaf Surface of Butterwort

An insectivorous plant, the butterwort (Pinguicula vulgaris) has modified leaves which bear tiny granular trichomes which trap insects. The capitate head of the trichome then secretes protease enzymes to digest the insect parts.

Barley Root Tip

Critical point dried tip of barley (Hordeum vulgare) root, demonstrating root cap cells (calyptra) and slightly deformed (compressed) root hairs (Pili).
E3100 Critical Point Dryer

QUICK OVERVIEW

The E3100 large chamber critical point dryer has been an industry standard for over 35 years and is used in numerous scanning electron microscopy (SEM) laboratories around the world. Primarily used for critical drying of biological and geological specimens, the E3100 can also be used for the controlled drying of MEMs, aerogels and hydrogels.

The design of the E3100 features a large, horizontal pressure chamber measuring 63.5 mm internal diameter x 82 mm in length. The chamber has an external water jacket for temperature control and specimens are introduced via a removable rear door. The front of the chamber is fitted with a 25 mm diameter window which gives an unsurpassed view of the liquid level during the critical point drying process.

KEY FEATURES

- Proven reliability - over 6,000 critical point dryer installations worldwide
- Simple robust construction - easy to maintain - many critical point dryer users carry out their own routine maintenance
- Horizontal chamber and large viewing window - excellent visibility of the fluid level and drying process
- Large robust valves for draining of fluids, ingress of CO₂ and venting of gas - very durable; the rapid ingress of CO₂ helps prevent pre-drying of specimens
- Safety - every critical point dryer unit is pressure tested to 2,500psi and a certificate is issued. A pressure bursting disc is also fitted to safeguard against misuse
- Specimen handling - optional specimen holders for coverslips and TEM grids. Porous pots are available for fragile or very small specimens
- Three-year warranty

Temperature control

Dial gauges display pressure in the chamber and the temperature of water circulating through the jacket. Three pressure valves permit easy connection to the liquid CO₂ cylinder and allow liquid agitation and venting of the chamber.

A source of hot running water is essential. Cooling is also useful, especially for sequential critical point drying process runs and/or in laboratories where the room temperature may be high.

The temperature of the E3100 chamber is raised with a hot water supply. Mains water can be used but a more elegant method involves the use of the optional E4860 Recirculating Heater/Chiller which can be used to pre-cool the chamber to below ambient temperature prior to loading specimens and then to heat the chamber to the critical temperature.

Safety

Operator safety is of course an important consideration with all pressure vessels. If during the critical point drying process the pressure and temperature are inadvertently exceeded, a safety bursting disc is incorporated in the chamber support. The design has been independently type-tested to proof pressures in excess of the working pressure and bursting disc rupture pressure.

Specimen holder (boat)

An important feature is the design of the E3100 transfer boat. This permits specimens in the intermediate fluid to be transferred to the chamber of the critical point dryer. On sealing the chamber, the intermediate fluid begins to drain and can be replaced with liquid CO₂. In this way the specimens are never allowed to dry out during the loading and transfer stage of the critical point drying process.

The E3100 is supplied with the E3100-01 tissue boat which has three slots each with three tissue baskets, making a total of nine. Optional holders are available and are listed under Ordering Information.

Bonded chamber seals – Nitrile or EPDM?

The EMS 3100 is fitted with a standard nitrile bonded window and door seals. Nitrile is a good general material due to its ability to withstand attack by solvents, such as ethanol. However, if acetone is used as the transition fluid then the EPDM seals have been found to be more resistant to chemical attack by that solvent.

If you are planning to use acetone as the transition fluid, please state this on the order and EPDM bonded seals will be fitted.

For existing instruments, both Nitrile and EPDM bonded seal can be ordered as spare parts.
E3100 Critical Point Dryer (continued)

**OPTIONS AND ACCESSORIES**

**Glass microscope coverslip holder (option):**
Specially adapted boats allow glass coverslips to be held firmly during drying. The E3000-02 is designed for the E3000 and has a maximum capacity of seven coverslips. Likewise, the larger E3100-02 coverslip boat is available for the E3100 ‘Jumbo’ Critical Point Dryer and has a carrying capacity of 21 coverslips.

**TEM grid holder (option):**
The E3000-1 holder for 3.05mm grids and the E3000-2 grid holder for 2.3mm grids can be used with all Electron Microscopy Sciences critical point dryers. Maximum number of grids is three.

**Porous pots with lids (option):**
E800A solvent-resistant porous pots (12.7mm x 15.5mm) with lids are ideal for very small or very delicate specimens.

**Service Kits:**
Service kits are available; see the ordering table below. Please call our service department for specific questions.

**Site Requirements**

**Site selection:** The apparatus should be positioned in the laboratory with convenient access to:
- Hot and cold water supply (if the optional E4860 Recirculating Heater/Chiller are not used)
- Mains power supply (for E4860 only)
- Fume cupboard or window, or an area of good ventilation
- Space for CO₂, siphon cylinder

**CO₂ Cylinder:** The E3100 requires a cylinder of liquid CO₂, fitted with a siphon tube (indicated by a vertical white stripe on the cylinder). If there is any doubt regarding the presence of a siphon tube, advice should be sought from the gas supplier.

Cylinder connection threads vary from country to country and even between manufacturers in the same country. For example, the transfer pipe supplied is fitted with ¼” British Standard Pipe (BSP) and 0.86” x 14 TPI union. These are standard threads for the UK and generally in the rest of the world, but will not fit cylinders in the USA.

**Heating and cooling:** Use a mixer to the laboratory hot and cold water outlets, terminating with a 6mm/¼” hose connection for the PVC tubing supplied. A ‘Y’ piece connected to the hot and cold water taps is also suitable.

The E3100 requires both hot and cold water during the operating cycle. Cooling facilitates filling of the work chamber with liquid CO₂, and heating is required to take the liquid above its critical point.

Good control of the water temperature is essential for good results, hence the recommended use of the the E4860 Recirculating Heater/Chiller which gives precise control of cooling and heating.

**Space requirement:** A minimum bench space of approximately 230 x 230mm is required.

**ORDERING INFORMATION**

- **E3100**
  - Large Chamber Critical Point Dryer
  - Chamber dimensions: 63.5mm Ø x 82mm length
  - Supplied with:
    - E3100-01 Specimen holder for tissue (boat)
    - 1m liquid CO₂ delivery tube
    - O ring and L gasket set (including window and door bonded seals)
    - Spare bursting disc and retaining copper (Cu) washer
    - Steel bar for tightening/untightening the door
    - Flat wrench (for removing the window retaining ring)
    - Comprehensive manual
    - Pressure test certificate

- **E3100-061**
  - Service Kit for E3100
The K850 Critical Point Dryer is designed for use with CO₂, having first replaced any water in the specimen by a series of dehydration, often in the same fluid such as Acetone, which will also be the intermediate fluid. 

(Wet Specimen)–Water–Acetone–30%–100%–CO₂–C.P.D.–(Dry Specimen)

The specimens for critical point drying are located in the pressure chamber of the K850. The chamber is pre-cooled to allow it to be readily filled with liquid CO₂ from a gas cylinder. The chamber is then heated to just above the critical temperature with subsequent critical pressure being achieved. The CO₂ gas is vented through a needle valve, to avoid specimen distortion.

The K850 is fitted with thermoelectronic Heating and Cooling and Temperature control of +5°C on Cooling, and +35°C on Heating. This ensures the critical point is accurately obtained, avoiding excess pressures or temperatures, or the need to rely on pressure relief valves to control pressure during the heating cycle. The chamber is vertical, with top loading, to ensure specimens do not become uncovered during the drying process, with a side viewing port to locate the miniscus for the correct level when initially filling the chamber.

The K850 is fitted with a fine let down needle as standard and flow gauge is no longer required.

FEATURES

- Vertical chamber with top filling and bottom draining.
- Normal operating temperature 35°C pressure 1500 psi.
- Thermoelectric Peltier cooling and heating.
- Fine control needle valve pressure letdown.
- Illuminated chamber with side viewing port and protective ‘Lexan’ shield.
- Stirrer system for enhanced solvent exchange.
- Temperature monitoring and control with thermal cut-out protection.
- Pressure monitoring with pressure relief valve and rupture disc protection.
- Polycarbonate safety shield.

K850WM
Large Chamber Critical Point Dryer

The K850WM is compact, bench-top instrument designed to critical point dry a complete 150mm/6" wafer. A convenient wafer holder allows rapid transfer and ensures that pre-drying does not occur.

FEATURES

- 170mm diameter chamber - optimized for wafer/MEMS drying
- Vertical chamber with top-loading and bottom draining - ensures specimens do not become uncovered during drying
- Thermoelectric heating - accurate temperature control
- Fine control needle valve pressure let down - precise control
- Temperature monitoring and control with thermal cut-out protection
- Pressure monitoring with safety cut-out for over pressure
- Three-year warranty

The K850WM has built-in heating and water cooling using the E4860 Recirculating Heater/Chiller. This combination will give temperature control of +5°C cooling and +35°C during heating. This ensures the critical point is accurately obtained, avoiding excess pressures or temperatures, or the need to rely on pressure relief valves to control pressure during the heating cycle.

The K850WM has a vertical chamber which allows top-loading of specimens. A viewing port is fitted in the top plate for specimen observation. The specimen exchange mechanism is simple to use and ensures the specimen remains under liquid during loading.

Specimen handling

100mm or 150mm diameter wafers are held in a PTFE holding tray. The tray including wafer is immersed in acetone in order to remove all moisture from the specimen. After dehydration, the wafer and holder are transferred into the pre-cooled specimen chamber using the wafer transfer device. On completion of the critical point drying process, the wafer is removed from the chamber using the transfer device prior to further processing.

Requirements

- Mature Barley Root
  Critical point dried transverse fracture of a mature barley (Hordeum vulgare) root, demonstrating central stelle and surrounding cortical cells. Root hairs (Pili) are also obvious.

- Aphid
  Critical point dried aphid on a leaf surface.

- Bamboo Stem
  Transverse fracture of the stem of young bamboo (Bambusa sp), demonstrating xylem and phloem bundles and heavily thickened (lignified) epidermal and hypodermal cells.
What is... Cryogenic Specimen Preparation?
In this instance we are referring to frozen hydrated bulk specimens for SEM, commonly termed Cryo-SEM. When biological specimens are prepared by alternative methods, such as critical point drying, they may collapse and distort due to the removal of their water content. In addition, diffusible elements are often removed or relocated, affecting the validity of subsequent X-ray microanalysis. Cryo-SEM offers the best solution to this and in addition allows observation and analysis of liquid, semi-liquid and beam-sensitive specimens, such as emulsions, suspensions and foams. Cryo preparation is increasingly being used with FIB/SEM instruments for a wide range of specimen types, including some materials where low temperature milling conditions are desirable.

For biological and other “wet” specimens rapid freezing is essential in order to reduce morphological distortion, a key consideration for structural observation. The aim of fast freezing is to reduce the size of ice crystals within specimens by reaching as quickly as possible the point at which recrystallization takes place (for pure water this is in the order of -130°C) and maintaining the specimen below this temperature during transfer, preparation and observation. For larger specimens commonly used in SEM and FIB/SEM rapid freezing is normally done by plunging into liquid nitrogen in its ‘slushy’ form at -210°C. This is the standard method supplied with the PP3010, but it is also fitted with an “advanced specimen handling” system which allows specimens that have been frozen by alternative (faster) freezing methods to be manipulated and loaded under liquid nitrogen and then transferred under vacuum into the PP3010 for subsequent processing and observation.

Techniques and Applications
Cryo-SEM — the advantages
The Scanning Electron Microscopist is faced with the inescapable fact that liquid is a fundamental part of practically all lifesciences – and many materials – specimens. Since water occupies up to 98% of some animal and plant tissues it represents a most formidable specimen problem to most Scanning Electron Microscopists. Cryo-SEM is a quick, reliable and effective way to overcome these not inconsiderable SEM preparation problems. Additionally the technique is widely used for observing ‘difficult’ samples, such as those with greater beam sensitivity and of an unstable nature. An important application, often overlooked, is the ability to use cryo-SEM to study dynamic processes (industrial or otherwise) by using a series of time resolved samples. Naturally the advent of various “higher pressure” modes, such as VP, LV and ESEM has allowed such samples examined in SEM without resorting to freezing or drying methods. However, cryo-SEM is still by far the most effective method of preventing sample water loss, which will in fact occur at any vacuum level –even with Peltier stages fitted to the SEM and the careful addition of water vapor in the SEM chamber. Cryo-SEM also a number of a additional advantages, including the ability to fracture and selectively remove surface water (ice) by controlled specimen sublimation.

Advantages of cryo-SEM:

Why choose cryo-SEM?
The limitations of conventional ‘wet processing’ include:

- Shrinkage and distortion
- Extraction of soluble materials
- Relocation of highly diffusible elements
- Mechanical damage (fragile specimens can be damaged during conventional processing)
- Slow (24 hours or longer)
- Toxic reagents are required (fixatives, buffers etc)

- Specimen viewed in fully hydrated state
- Soluble materials are retained
- Less relocation of highly diffusible elements
- Little or no mechanical damage
- Time lapse experiments and evaluating industrial processes at timed intervals
- Usually no exposure to toxic reagents
- Rapid process
- High resolution capability (compared to low-vacuum techniques)
- Extra information obtained by low-temperature fracturing (compared with conventional and low-vacuum methods)
- Good for liquid, semi-liquids and beam sensitive specimens
- Ability to selectively etch (sublimate to reveal information)
- Ability to ‘rework’ specimen (eg re-fracture and coat)

Zoological

Frozen hydrated aphid
In comparison with the critical point dried aphid, this image shows that there is no distortion of the abdomen nor any other part of the aphid following freeze drying.

Botanical

Pollen of cactus Zygocactus truncatus
Germinating pollen grains of Zygocactus truncatus.

Fungi

Baker’s yeast (Saccharomyces cerevisiae)
The specimen was rapidly frozen in nitrogen slush, fractured and coated with 4nm of platinum (Pt). 10nm yeast cell transmembrane particles (in hexagonal arrays) can be observed.
Techniques and Applications
A summary of the cryo-SEM preparation technique

Cryo preparation techniques for scanning electron microscopy (SEM) have become essential for the observation of wet or “beam sensitive” specimens. Using such techniques removes the need for conventional preparation techniques, such as critical point drying or freeze-drying, and allows observation of the specimen in its ‘natural’ hydrated state.

The specimen is rapidly cooled and transferred under vacuum to the cold stage of the preparation chamber, which is mounted onto the SEM chamber. The preparation chamber is pumped with a rotary pump (PP2000) or by a specially designed turbomolecular pumping system (PP2000T). The specimen can be fractured, sublimated (“etched”) to reveal greater detail, and coated with metal by sputtering or with carbon by thermal evaporation.

Finally, the specimen can be moved under vacuum into the SEM chamber where it is easily located on a cold stage specifically tailored to the SEM. At all stages of the procedure the specimen is maintained at a ‘safe’ temperature of typically lower than -140°C.

Typical applications
Biological sciences including botany, mycology, zoology, biotechnology and biomedical – plus economically import agricultural sciences.

More recently cryo-SEM is becoming an essential tool for pharmaceutical, cosmetics and healthcare industries, where it is used in basic applied research and for routine QA of many products, such as creams, cosmetics and drug delivery systems.

Cryo-SEM has long been a standard preparation method in the food industry. Of interest are multi-phase products, such as ice cream, confectionery and dairy products.

Botanical: Cryo-SEM is the perfect method for highly hydrated botanical material.

Some specimen mounting techniques for cryo-SEM

Surface mounting
This technique is used for leaf specimens etc. Roughen stub surface with fine emery paper. Specimen is laid on top of mounting media.

Edge mounting
This technique is used for edge observation and fracture. Roughen surface of stub with fine emery paper. Specimen is placed on its edge in a machined slot and secured with mounting media.

Film emulsion mounting
This technique is useful when a small specimen would be obscured by the Tissue-Tek mounting media, or when specimens need to be recovered. Specimens need to be slightly damp to use this method (good for nematode worms). The specimen is laid on surface so that its dampness slightly dissolves the film emulsion allowing the specimen to adhere to the film surface. Exposed unused film with the emulsion side uppermost is secured to the stub with mounting media. It may be useful to scrape off the protective coating of the film emulsion first to assist conductivity.

Rivet mounting
For liquids and for when specimens need to be frozen off the stub to achieve fast freezing rates. The rivet is placed in the hole and filled with liquid prior to freezing. If the specimen needs to be frozen away from the stub, two liquid-filled rivets are held together and then frozen prior to transfer onto the stub.

Alternative rivet mounting method

Pipette liquid sample into tube
Place metal rivet or small piece of plastic tubing on top of hole (containing liquid sample). Note: Small drop of “Super Glue” can be used to hold tube to stub.

Freeze & transfer onto preparation chamber cold stage

Result: clean surface fracture

EQUIPMENT & ACCESSORIES CATALOG EDITION IV
CRYO-SEM & CRYO-FIB/SEM PREPARATION SYSTEMS

Stable emulsion of a hydrophobic polymer
This image illustrates a stable emulsion of a synthetic liquid polymer dispersed in an aqueous continuous phase.
PRODUCT FEATURES
Mounting, Freezing and Transferring Specimens — easy with the Prepdek® Workstation
The PP3010 Prepdek® workstation is fitted with a slushy nitrogen freezing station, connected to the pumping system. Rapid freezing reduces ice crystal damage and results in improved specimen preservation. For handling pre-frozen material the Prepdek® freezing system allows specimens that have been frozen by alternative freezing methods (or stored field specimens) to be manipulated — in or just above liquid nitrogen — and then transferred under vacuum into the PP3010 preparation chamber for subsequent processing and observation.

Additionally the TEM Prep Slusher and Glove Box Interface/Airlock options allow workflow amongst a range of other platforms, including cryo-TEM, cryoultramicro, XPS and glove box.

OVERVIEW
The PP3010 is a highly automated, easy-to-use, column-mounted, gas-cooled cryo preparation system suitable for most makes and models of SEM, FE-SEM and FIB/SEM. The PP3010 has all the facilities needed to rapidly freeze, process and transfer specimens. The cryo preparation chamber is turbomolecular pumped and includes tools for cold fracturing, controlled automatic sublimation and sputter coating. After processing, the specimen is transferred from the cryo preparation chamber onto a highly stable SEM cold stage for observation. Cold trapping in the cryo preparation chamber and SEM chamber ensures the whole process is frost-free. Specimen process times are typically between five and ten minutes.

KEY FEATURES
- High resolution performance on SEM, FE-SEM and FIB/SEMs
- Totally gas cooled, including cryo preparation chamber — no boiling nitrogen on the SEM
- Efficient cooling (down to at least -190°C)
- 24 hours plus run times on one fill of LN2 are typical — allowing unattended overnight operation (at typical operating temperatures)
- Large recipe driven touch-screen interface
- Automated sublimation, coating and system start up
- Superb specimen visibility (including preparation chamber CCD camera)
- Fully compatible with SEM beam deceleration/stage bias modes up to 5kV
- Off specimen cooling and pumping systems — minimum mass on the SEM
- On-screen data logging and diagnostics
- Pumped storage of the cryo transfer device
- Prepdek® workstation — self contained work area, extra bench space not required
- Cryo workflow options
- Specialist support and three-year warranty
Cryo Transfer Device – Including Vacuum Storage
The vacuum transfer device is compact (fits easily into one hand), reliably vacuum-tight and has a bayonet connection to the specimen shuttle to ensure rapid pick up and transfer.
Set into the Prepdek® work surface is a pumped storage tube for the cryo transfer device (see Prepdek® workstation section below).

Specimen Stubs, Shuttles
The PP3010 is supplied with universal 10 mm specimen stubs with surface slots, holes and a flat area – useful for most specimen types. Blank and slotted stubs are also included. In addition a range of optional holders is available, including shuttles for large specimens and top-loading holders for high pressure freezing, TEM Autogrid® (for cryo-FIB/SEM applications) and clamping shuttles for hard specimens.

Cryo Preparation Chamber
The cryo preparation chamber is connected directly to the microscope and includes a highly efficient nitrogen gas cold stage, extensive cold trapping and facilities to fracture, sublimate and sputter coat specimens. The chamber is fitted with two fully integrated and interlocked gate valves. The outer load-lock valve includes a pumped airlock which accepts the cryo transfer device – the inner SEM valve ensures rapid high-vacuum to high-vacuum specimen exchange.

Highly Efficient Gas Cooled Stage and Cold Traps
At the heart of the cryo preparation chamber is a nitrogen gas cooled specimen stage. The stage has a dovetail fitting to accept a cryo shuttle and can be precisely controlled over a temperature range from 100°C to -190°C or lower. Large gas cooled cold traps located above, below and behind the specimen stage ensure clean, high vacuum conditions in the chamber.
Both the cold stage and cold traps are cooled with the fully integrated CHE3010 off-column cooling system (see below), which at normal operating temperatures give typical hold times of at up to 24 hours between fills (provided the nitrogen gas is dry).

High Visibility – Plus CCD Camera
There is superb visibility into the preparation chamber. In addition to the large front window (75 x 150 mm), there are two top viewing ports. The chamber is lit by three LEDS and a CCD camera allows the specimen cold stage area to be viewed on the control screen and the images saved.
An optional stereo microscope can be fitted to the cryo preparation chamber.

Cold Fracturing
Twin fracturing tools manipulators (actively cooled) are available and allow a range of specimen types to be cold fractured.
The PP3010 is fitted as standard with a front mounted fracturing and manipulation device. The ball-jointed mount offers flexible movement of the blade which can be used both as a surface pick (probe) and a fracturing knife.
An optional micrometer-advanced fracturing tool with rigid blade is available, in addition to the standard front-mounted tool.
Fractured fragments are captured in the large cold trap located below the specimen stage.

Automatic Sublimation and Sputtering
Sublimation temperatures and times can be preset and stored for easy retrieval. The process is fully automatic and graphically displayed on the control screen, showing the actual verses the predicted temperature curves.
The high resolution sputter coater is based on the market leading series of bench top coaters. The coating system will give fine grain films essential for FE-SEM applications. A platinum target is fitted as standard – optional metals include gold, gold/palladium, chromium and iridium. An optional fully integrated carbon fiber evaporation head can also be fitted. An optional terminating film thickness monitor is available.
**Face Cream**

Anti-aging face cream. Specimen rapidly frozen in slushy nitrogen, fractured at -140°C and sputter coated with 5nm of platinum.

**Mayonnaise**

Image courtesy of FEI Company.

**Shaving Cream**

Fractured at -140°C, sublimated at -90°C for 3 minutes and coated with 5nm of platinum.

**SEM Cold Stage, Cold Trap and Cooling System**

A highly stable, thermally isolated, nitrogen gas-cooled stage attaches to the SEM stage. The SEM stage and cold trap are cooled by separate cold gas circuits – both capable of reaching temperatures of -190°C or lower. This configuration allows the operator to select stage and cold trap temperatures that are optimized for specific specimens. For example, for some non-biological materials, it is useful to hold the specimen at very low temperatures – for example, a cold stage temperature of -175°C.

This is possible with the PP3010, as cold trap temperatures of -190°C or lower can be selected, but not possible with conduction cooled

**Panel PC Touch Screen User Interface**

The PP3010 is controlled using a large touch screen panel PC, mounted on the Prepdek® workstation. User-defined ‘recipes’ can be entered and stored for instant future access. The screen can be set to suit operator preferences; for example, vacuum measurement can be displayed in millibar, Pascal or Torr.

Many of the key steps in the specimen preparation process are automated (system set up, gas flow control, sublimation and sputter coating).

**Prepdek® Workstation**

The Prepdek® workstation has been designed to allow specimen mounting, freezing (plus pre-frozen specimen manipulation) and transfer device storage on one ergonomically designed work surface. The control electronics are mounted in a sealed but accessible cabinet beneath the Prepdek®.

Set into the work surface is a pumped storage tube which allows the cryo transfer device to be stored under vacuum conditions when not in use.

**Turbomolecular Pumping – High Vacuum Performance**

The preparation chamber is pumped by a remotely-positioned 70 L/s turbomolecular pumping system. Typical preparation chamber vacuums when cold are in the region of 10^-7mbar or better. Positioning the turbomolecular pump away from the SEM ensures total elimination of mechanical vibration and has the advantage of significantly reducing the total cryo system mass connected to the SEM. A vacuum buffer tank (remotely located in the Prepdek®) is automatically pumped when required. The pumping system is connected to the preparation chamber by flexible stainless-steel bellows, which allows flexible positioning of the pumping system.

A 5 m³/hr rotary vacuum pump is required to "back" the turbomolecular pump and for slushing and rough pumping operations. The rotary pump can be located up to five meters from the system, allowing remote location if required. Dry pumping alternatives are available – see Ordering Information.
Gas-cooled SEM cold trap (temperatures down to -190°C). Tailor-made to suit each SEM systems. The SEM cold stage has a temperature range of down to -190°C and a temperature stability of < 0.5°C.

Compatibility with SEM Stage Bias Mode
The PP3010 cold stage is fully compatible with SEM stage bias/beam deceleration modes of up to 5kV.

CHE3010 Off-Column Cooling
The CHE3010 is a fully integrated, remotely mounted cooling system which comes as standard with every PP3010. The CHE3010 is used to cool the SEM stage, SEM cold trap and cryo preparation chamber cold stage and cold traps and will typically reach temperatures down to -90°C or lower.

The CHE3010 is remotely positioned (typically on the floor behind the microscope) and at normal operating temperatures can run for up to 24 hours between fills. This greatly simplifies the cryo process (no more checking on dewar status and topping off), but also allows overnight, unattended operation – particularly useful for some automated FIB/SEM “slice and view” protocols.

Single Port Interface to the SEM or FIB/SEM
Where SEM geometry allows, both the cryo preparation chamber and the SEM cooling system can be fitted to a single chamber port (the minimum port diameter is 38 mm). This gives a tidy installation and frees up a valuable chamber port.

OPTIONS AND ACCESSORIES

Rapid Warming Tower for the CHE3010
This device is meant to facilitate a rapid warming of the CHE3010 (Cryo-Heat Exchanger) associated with the PP3010 Cryo-SEM preparation system. The Rapid Warming Tower in conjunction with a 1 liter/min Nitrogen gas flow rate dramatically reduces the lag time before the SEM or Prep chamber components return to room temperature so venting can occur. A process that normally takes hours can be completed in minutes, allowing maintenance or reconfiguring the SEM back to room temperature operation. Accepts many common, locally obtained hair dryers. (Hair Dryer not included).

Specimen shuttles and stubs
The PP3010 is supplied with a selection of holders, and a range of additional specimen shuttles and stubs is also available. (See Ordering Information for details).

Carbon Evaporation and Film Thickness Monitor
A carbon evaporation attachment and a terminating film thickness monitor can be fitted. Both are fully integrated (no external control boxes required).

Pressurized LN₂ Dewar
The PP7450/60L is a highly recommended option that generates dry nitrogen gas used for cooling the SEM cold stage & cold trap and cryo preparation chamber and cold shields. In addition, LN₂ can be decanted for slushing (freezing). During normal operation the PP7450/60L will generate dry nitrogen gas for up to eight days usage. If the PP7450/60L is not included, appropriate, locally sourced, nitrogen gas cylinders can be used. It is important to ensure that it has low moisture content – if in doubt, please contact us.

Cryoflow Work Options

Glove Box Valve/Airlock Interface
The airlock is connected to a glove box using a generic NW fitting and for most applications requires a suitable pumping system (rotary pump or turbomolecular plus diaphragm pumping system). The airlock is designed to accept the PP3010 vacuum transfer device.

For full details of this and other accessories please see Ordering Information.

TEM Prep Slusher Option
Offers an easy, convenient way of transporting pre-frozen specimens to and from the PP3010.

- Conveniently locates into the Prepdek® workstation of the PP3010
- Freely transportable, e.g. between high pressure freezer, cryoultramicrotome and the PP3010
- Ideal for loading/unloading TEM grids and grid holders
- Tilting holder for cryo shuttles (holders). Allows the easy transfer of specimens from external freezers (e.g. high pressure, jet, slam etc)
- Option for PP3010 and previous PP3000T and PP2000/PP2000T models

Pre-Frozen Sample Loading Jig for PP3010
This loading jig allows you to comfortably load pre-frozen samples, ie: HPF or Rivets, into the PP3010 specimen shuttles (not included). The loaded shuttles can then be transferred to the PP3010 slushing pot on the Prepdek®. Includes the LN₂ container, Lexan cover, loading jig, and a short transfer rod.
**SPECIFICATIONS**

**Cryo Preparation Chamber (column-mounted)**
- Gas cooled preparation chamber with a twenty-four hour run time between fills: Yes
- Two integral gate valves (loading and SEM) with appropriate electrical interlocks: Yes
- Variable temperature gas-cooled specimen stage: Yes
- Large cold shield above, below, and behind the cold stage: Yes
- Robust micrometer-fed fracturing knife (actively cooled): Option
- Side-mounted surface knife/probe (actively cooled): A range of scalpel blades can be fitted to suit different specimen requirements: Yes
- Automatic sublimation (controlled and viewed on the touch screen): Yes
- Fully automatic, high resolution sputter coater with platinum (Pt) target. (Other targets, including gold (Au), gold/palladium (Au/Pd), chromium (Cr), and iridium (Ir), are available as options.) Sputtering controlled and viewed on the user touch screen: Yes
- Carbon fiber evaporation head and power supply: Option
- Large front viewing window (150 x 78mm) plus top viewing ports: Yes
- Preparation chamber camera (CCD): Yes
- Vacuum transfer device: Yes
- Chamber illumination — three LEDs: Yes

**Pumping System and Controls**
- Remotely-mounted turbomolecular pumping system (70L/s). Includes: vacuum buffer tank, vacuum valves and stainless-steel bellows connection to the preparation chamber. Typical preparation chamber vacuum when cold: 10^-7 mbar: Yes
- Single 50L/m rotary pump required: Order separately

**SEM Cooling Dewar, SEM Cold Stage and Cold Trap (anticontaminator)**
- Gas-cooled nitrogen cold stage assembly (-190°C). Temperature stability of >0.5°C: Yes
- Separate gas-cooling circuits for SEM stage and SEM anti-contaminator: Yes
- 2L capacity, off-column cooling dewar with run time between fills of up to 24 hours: Yes
- SEM CCD camera-fitted when space allows: Yes
- LED lighting (interlocked): Yes

**System Control and Specimen Handling**
- Control via a color user touch screen monitor (15") mounted on the Prepdek®: Yes
  - Multi-ability user interface screen
  - Quick, easy overview of system status
  - User-definable "recipes" can be stored
  - Quick access to videos outlining preparation techniques and system maintenance
  - Fully automatic sputtering
  - Automatic sublimation
  - Quick, easy overview of system status
  - CCD camera image of preparation chamber
- Twin liquid nitrogen slushing and specimen handling system — ideal for handling pre-frozen specimens: Yes
- Mounted on the Prepdek®: Yes
- System electronics stored in a ventilated, sealed unit under the Prepdek®: Yes
- Specimen shuttles (6): E7449-9 multi-specimen stubs (pack of 10) and E7402 blank aluminium (Al) stubs (pack of 10). Other shuttles and stubs available — see Ordering Information: Yes

**Specimen Shuttles and Stubs** (Others available — see Ordering Information)
- (2) Specimen shuttles (to hold 10 mm diameter cryo stubs): Yes
- Blank 10 mm stubs – pack of 10
- Multi-stubs 7 mm high (with holes and slots) – pack of 5
- Multi-stubs 5 mm high (with holes and slots) – pack of 5
- Dovetail holder shuttle
- Brass rivets for fracturing liquids – pack of 100
- Copper (Cu) stub with 3 mm x 3 mm slot – pack of 5
- Copper (Cu) stub with 1 mm x 3 mm slot – pack of 5

**Installation and Training**
- Installation and training at the customer site: Contact EMS
- Support and Other Information
  - Comprehensive start-up kit with key spares: Yes
  - Three-year warranty: Yes
  - SEM column interfaces and SEM stage adaptor (tailored to each microscope): Yes
  - Some Options and Accessories (see Ordering Information for full list)
    - Terminating film thickness monitor (FTM): Option
    - Self-pressurizing LN2 dewar and regulator (for storage and venting): Option
    - Carbon fiber evaporation head: Option
    - Wide range of specimen holders and specimen stubs: Option

**System Control and Specimen Handling**
- Control via a color user touch screen monitor (15") mounted on the Prepdek®: Yes
  - Multi-ability user interface screen
  - Quick, easy overview of system status
  - User-definable "recipes" can be stored
  - Quick access to videos outlining preparation techniques and system maintenance
  - Fully automatic sputtering
  - Automatic sublimation
  - Quick, easy overview of system status
  - CCD camera image of preparation chamber
- Twin liquid nitrogen slushing and specimen handling system — ideal for handling pre-frozen specimens: Yes
- Mounted on the Prepdek®: Yes
- System electronics stored in a ventilated, sealed unit under the Prepdek®: Yes
- Specimen shuttles (6): E7449-9 multi-specimen stubs (pack of 10) and E7402 blank aluminium (Al) stubs (pack of 10). Other shuttles and stubs available — see Ordering Information: Yes

**Specimen Shuttles and Stubs** (Others available — see Ordering Information)
- (2) Specimen shuttles (to hold 10 mm diameter cryo stubs): Yes
- Blank 10 mm stubs – pack of 10
- Multi-stubs 7 mm high (with holes and slots) – pack of 5
- Multi-stubs 5 mm high (with holes and slots) – pack of 5
- Dovetail holder shuttle
- Brass rivets for fracturing liquids – pack of 100
- Copper (Cu) stub with 3 mm x 3 mm slot – pack of 5
- Copper (Cu) stub with 1 mm x 3 mm slot – pack of 5

**Installation and Training**
- Installation and training at the customer site: Contact EMS
- Support and Other Information
  - Comprehensive start-up kit with key spares: Yes
  - Three-year warranty: Yes
  - SEM column interfaces and SEM stage adaptor (tailored to each microscope): Yes
  - Some Options and Accessories (see Ordering Information for full list)
    - Terminating film thickness monitor (FTM): Option
    - Self-pressurizing LN2 dewar and regulator (for storage and venting): Option
    - Carbon fiber evaporation head: Option
    - Wide range of specimen holders and specimen stubs: Option
### PP3010 Cryo-SEM/Cryo-FIB/SEM Preparation System (continued)

![Equipment & Accessories Catalog Edition IV](EMS Equipment Catalog_2023A_58-72.png)
Cryo Transfer Systems

Building on the success of the PP3010 cryo-SEM/FIB/SEM preparation system, we are pleased to announce three new related products for ambient and cryo temperature transfer.

**PP3004 QuickLok**

*Ambient temperature airlock for SEM, FIB/SEM, beamline and vacuum platforms*

**Quick Overview**

The QuickLok provides a rapid way of transferring ambient temperature specimens into SEM, FIB/SEM or other suitable vacuum systems. A key feature of the QuickLok is the ability to vacuum transfer specimens that are sensitive to normal environmental conditions. The transfer device uses a sealed vacuum chamber which can be interfaced to a glove box for inert gas transfer or allow vacuum transfer from a wide range of platforms.

**Key Features**

- Rapid specimen exchange
- Vacuum and inert gas transfer
- Field-retrofittable to most systems
- Upgrade path to CoolLok
- Custom designed holders available
- 3 year warranty

**Components**

Mounted onto a suitable vacuum chamber port, the QuickLok consists of a loading chamber body with integrated controls for pumping, venting and transfer. A custom-designed interface flange and connections to the pumping system are included (see Pumping below).

The compact vacuum transfer device has an easy-release bayonet fitting to a dovetail-profile specimen holder (shuttle). Standard shuttles are included, but optional holders allow a range of specimen types to be handled.

Inside the microscope is a stage to accept the specimen shuttle. To aid specimen exchange an interlocked LED chamber light is mounted to the inside of the QuickLok interface.

**Use**

The specimen is mounted on a suitable holder and the transfer device fitted onto the QuickLok. The airlock and transfer device are then evacuated to a pre-set vacuum and the gate valve opened. The specimen is then guided onto the microscope stage.

For transfer from other vacuum systems, or a glove box, additional interface flanges are available on request.

**Pumping**

The QuickLok requires either a rotary pump or oil-free vacuum turbomolecular pumping station (see Options).
Cryo Transfer Systems (continued)

PP3005 SEMCool

Non-airlock cryo cooling for SEM, FIB/SEM, beamline and vacuum platforms

Quick Overview

The SEMCool is based on the PP3006 CoolLok but without the PP3004 QuickLok components. It is designed for cryogenic applications where airlock exchange of specimens into the microscope is not required.

Key Features
- Temperature range down to -190°C, with stability better than 0.5°C
- Off-column cooling with all-day runtime between fills
- Independent cooling of cold stage and cold trap
- Upgrade path to CoolLok
- 3 year warranty

Components

Specimen holders and transfer device: The compact vacuum transfer device has an easy-release bayonet fitting to a dovetail-profile specimen holder (shuttle). Standard shuttles are included, but optional holders allow a range of different specimen types to be handled.

Cold stage and cold trap: A highly stable, thermally isolated, nitrogen gas-cooled cold stage attaches to the microscope stage. The location and shape of the cold trap is tailored to suit the internal geometry of the microscope. Both cold stage and cold trap are capable of reaching temperatures down to -190°C with a stability of <0.5°C. For easy specimen exchange an LED chamber light is fitted.

The cold stage connects to the microscope stage using an adaptor and has a dovetail fitting to accept a specimen holder. When not in use the cold stage is uncoupled and stored within the chamber with the gas and electrical fittings connected.

Cooling dewar, trolley and controller: The cold stage and cold trap are cooled by a remotely-positioned, vacuum isolated 21 L dewar and heat exchanger assembly which at normal operating temperatures can run for up to 24 hours between fills. The gas lines between the dewar and the microscope interface are vacuum isolated for maximum thermal efficiency.

The cooling dewar sits on a floor-mounted trolley which also houses the monitor/controller for cold stage and monitor for cold trap, plus nitrogen gas flow controllers.

Use

Vent the SEM, locate specimen holder on the cold stage, re-pump the SEM and then cool down to the required temperature. To exchange specimen, warm to above 0°C and vent the SEM.

Pumping

The SEMCool requires a rotary pump to periodically evacuate the vacuum isolated lines (see Ordering Information).
III Cryo Transfer Systems (continued)

**PP3006 CoolLok**

*Cryo transfer systems for SEM, FIB/SEM, beamline and vacuum platforms*

**Quick Overview**

The CoolLok offers rapid transfer and cryo temperature observation of specimens for SEM, FIB/SEM, beamline or other vacuum systems. Applications include thermal protection of beam-sensitive specimens and low temperature observation of materials such as plastics, polymers low-K dielectrics and hard-soft mixtures. The system can also be used for inert gas transfer of ambient temperature specimens from a glove box.

Please Note: The PP3006 is not a replacement for the PP3010, which is a full cryo preparation system. The PP3006 does not have a cryo preparation chamber and is designed for materials applications where cold fracturing and sputtering are not required.

**Key Features**

- Rapid specimen exchange
- Temperature range down to -190°C with stability better than 0.5°C
- Off-column cooling with all-day runtime between fills
- Independent cooling of cold stage and cold trap
- Vacuum or inert gas transfer
- Rapid specimen freezing option
- 3 year warranty

**Components**

**Vacuum airlock**

**Cold gas feedthrough**

Mounted onto a suitable vacuum chamber port, the CoolLok consists of a loading chamber body with built-in controls for pumping, venting and transfer. A custom-designed interface flange to the vacuum chamber and connections and fittings to the pumping system are included (see Pumping below). The interface has cold nitrogen gas feeds to and from the microscope cold stage and cold trap.

**Specimen holders and transfer device**

The compact vacuum transfer device has an easy-release bayonet fitting to a dovetail-profile specimen holder (shuttle). Standard shuttles are included, but optional holders allow a range of different specimen types to be handled.

**Cold stage and cold trap**

A highly stable, thermally isolated, nitrogen gas-cooled cold stage attaches to the microscope stage. The location and shape of the cold trap is tailored to suit the internal geometry of the microscope. Both cold stage and cold trap are capable of reaching temperatures down to
Cryo Transfer Systems (continued)

**PP3006 CoolLok (continued)**

-190°C with a stability of <0.5°C. For easy specimen exchange an LED chamber light is fitted.

The cold stage connects to the microscope stage using an adaptor and has a dovetail fitting to accept a specimen holder. When not in use the cold stage is uncoupled and stored within the chamber with the gas and electrical fittings connected.

**Cooling dewar, trolley and controller** The cold stage and cold trap are cooled by a remotely-positioned, vacuum isolated 21L dewar and heat exchanger assembly which at normal operating temperatures can run for up to 24 hours between fills. The gas lines between the dewar and the microscope interface are vacuum isolated for maximum thermal efficiency.

The cooling dewar sits on a floor-mounted trolley which also houses the monitor/controller for cold stage and monitor for cold trap, plus nitrogen gas flow controllers.

**Rapid freezing station (24429)** With the standard CoolLok, specimen freezing is by contact with the microscope cold stage following transfer and therefore freezing rates are relatively slow. This is suitable for hard, non-hydrated specimens, but for liquid-based material rapid freezing is essential to reduce the detrimental effects of ice crystal growth and to allow through-vacuum transfer onto the cold stage.

For these applications the optional nitrogen slush freezing station is required. However, for many applications (especially life sciences) cold fracturing and sputter coating are essential process steps and require the advanced capabilities of the EMS PP3010 – a full cryo preparation system.

**Use**

The specimen is mounted on a suitable holder (shuttle) and the transfer device fitted onto the airlock and the dead space evacuated to a pre-set vacuum level. The gate valve is opened and the specimen guided onto the SEM stage.

For transfer from other vacuum systems, or a glove box, additional interface flanges are available on request. Vacuum transfers can be made from the optional 24429 trolley-mounted nitrogen slush freezing station, if fitted.

**Pumping**

The QuickLok requires either a rotary pump or oil-free turbomolecular pumping station (see Options).

ORDERING INFORMATION

For a full quotation, including on-site installation and customer training, please contact us.

Pumping

The PP3004 QuickLok and PP3006 CoolLok require either a rotary pump or high vacuum turbomolecular pumping station (recommended). The PP3005 requires a rotary pump for evacuating the vacuum isolated gas lines.

- 13034: Pfeiffer Duo 6 — 5 m³/hr rotary vacuum pump with oil mist filter each
- 24426: Pfeiffer HiCube 80 turbomolecular and diaphragm pumping system each

Options and Accessories

- 24429: Rapid cooling station (for PP3006 only) each
- PP7450: Pressurized (60 L) LN₂ dewar. boil-off nitrogen gas is used for cooling the stage and cold trap (PP3005 and PP3006 only) each
- PP3050-RWT: CHE3010 Rapid Warming Tower each
- 13296: Sircal in-line gas dryer. Helps to reduce water content of nitrogen gas supply each

Specimen Holders

- 10245: Top-loading specimen shuttle for planchettes each
- 10246: Top-loading specimen shuttle, to take a 10mm stub each
- 10247: Top-loading specimen shuttle for rivets (vice style) each
- E7433: Rivet holder specimen stub, screw-down style for use with 10246 each
- E7449-5: Universal specimen stub with surface holes and slots (5 pack) each
- E7401: Specimen stub shuttle (spare) each
- E7402: Aluminum (Al) stubs (10 pack) each
- E7403: Copper (Cu) stubs (10 pack) each
- E7405: Screw down stub for thin, hard specimens each
- E7406: Copper (Cu) stubs with 3 x 3mm slots (5 pack) each
- E7407: Copper (Cu) stubs with 1 x 3mm slots (5 pack) each
- 32816510: Brass rivets for fracturing liquids (100 pack) each

Sputter Targets and Carbon Fiber

- E7400-314A: Gold (Au) target 0.008” thick each
- E7400-314B: Gold/palladium (Au/Pd) (80:20) target 0.2mm thick each
- E7400-314C: Platinum (Pt) target 0.008” thick each
- E7400-314IR: Iridium (Ir) target 0.008” thick each
- E7400-314CR: Chromium (Cr) target 0.3mm thick each
- 91047-1: Carbon fiber cord — high purity — 1m each
- 91047-5: Carbon fiber cord — high purity — 5m each
Dendritic Ice Crystals

If it is cooled slowly, water forms dendritic ice crystals. These can have a variety of branching patterns — the complexity of which depends upon cooling rate. Arms extend from the main body of the crystal at an angle of 60°. Some, such as the one illustrated, resemble the arms of a snowflake. Bar: 2um

Wax crystals in gas oil

When cooled to a temperature below about 2°C, the waxes in fuel oils such as this tend to crystallize out. Wax crystal size and shape can be varied by altering the rate at which the oil is cooled.

Stable emulsion of a hydrophobic polymer

This image illustrates a stable emulsion of a synthetic liquid polymer dispersed in an aqueous continuous phase.

Latex

Latex particles are very electron beam sensitive, so cryo-SEM is an ideal method for their observation.
EMS precious metal sputtering targets are made from high purity metals, starting 99.99% with most standard disc sizes, for use on most sputtering units from many manufacturers: Emissite, Emscope, Bio-Rad, Polaron, Edwards, Balzers, Plasma Sciences, Technics Hummers, Denton, Creasington, and much more.

Our targets come in a standard thickness of 0.1 mm (100μm). Other thickness, ranging from 0.05 to 6 mm, are available upon request. Targets are available mounted or unmounted whichever you prefer. For mounting please always state the make and the model of the sputtering unit so we can tend to it for you. Targets in other materials such as Chromium, Iridium etc. are available upon request. We also can manufacture targets with diameters from 4 mm to 304.8 mm (12”) Call for pricing.

**Ordering Information:**

EMS strives to maintain accurate pricing. However, due to fluctuations in precious metal prices, pricing on products containing precious metals is not guaranteed. We will contact you if there is a discrepancy.

**EMS Catalog Number**
The C-flat™ Family of Holey Carbon, Gold TEM Grids

C-flat™ by EMS in numerous configurations
Au-flat™ by EMS for high resolution imaging
CD-flat™ by EMS for automated S/TEM imaging and metrology

You can count on the same advantages, the same high quality, and the same product selection that makes the C-flat Family the premier holey carbon/gold grids for S/TEM and Cryo-TEM.

NIGHTSEA Fluorescence Viewing Systems

For many years, NIGHTSEA has developed practical and economical solutions for viewing and photographing fluorescence in the lab and in the field. Electron Microscopy Sciences is happy to announce that NIGHTSEA is now part of the EMS Family of Companies.

APPLICATIONS...
- Pre-screening
- Microdissection
- Failure Analysis
- Genotype Sorting
- Forensics

Electro microscope sciences... your source for the latest, the best, the most advanced

NEW PRODUCTS

Please visit our website to view or download our NEW PRODUCT FOCUS Catalog, featuring all these products and dozens more.

DYMO-Compatible Cryogenic Labels
Including CryoSTUCK® Thermal Transfer Labels and Freezer-DTermo™ Deep Freeze Labels.

Vortex™ Biopsy Cassettes
Small and Micro size. Biopsy Paper as well!

CellCeps+ Heated Forceps
For orientation and positioning of histological specimens during embedding in paraffin wax.

Planet-Safe® Petri Dishes
The world’s first 100% plant-based petri dish. Planet-Safe® Petri dishes are made from polylactic acid (PLA), a compostable and biodegradable resin derived from renewable non-GMO resources.

PEN Foil Bottom Sterile Dishes
Ideal for laser microdissection.

EMS CryoDefender Forceps
An EMS Exclusive. These unique forceps allow you to work for extended periods in a liquid nitrogen environment.
